PDF Version

Date: Apr 03, 2020 **Version:** 1.0.0-alpha

Links: [Repository](#) | [Issues](#) | [Releases](#) | [Community](#)

sasoptpy is a Python package that provides a modeling interface for SAS Optimization and SAS/OR optimization solvers. It provides a quick way for users to deploy optimization models and solve them using SAS Viya and SAS 9.4.

sasoptpy can handle linear, mixed integer linear, nonlinear, and black-box optimization problems. You can use native Python structures such as dictionaries, tuples, and lists to define an optimization problem. sasoptpy offers extensive support of [pandas](#) objects.

Under the hood, sasoptpy uses the [SAS Scripting Wrapper for Analytic Transfer \(SWAT\)](#) package to communicate with SAS Viya, and uses the [SASPy](#) package to communicate with SAS 9.4 installations.

sasoptpy is an interface to SAS Optimization solvers. See [SAS Optimization: Mathematical Optimization Procedures](#) for more information about SAS optimization tools.

See the SAS Global Forum paper: [Optimization Modeling with Python and SAS Viya](#)

OVERVIEW

1.1 About sasoptpy

sasoptpy is a Python package that provides easy and integrated ways of working with optimization solvers in SAS Optimization and SAS/OR. It enables developers to model optimization problems with ease by providing high-level building blocks.

1.1.1 Capabilities

sasoptpy is very flexible in terms of the optimization problem types and workflow alternatives.

Solvers

sasoptpy currently supports the following problem types:

- Linear problems
- Integer linear problems / Mixed integer linear problems
- Quadratic problems
- Nonlinear problems
- Black-box problems

Data

sasoptpy supports working with both client-side data and server-side data. When data are available on the client, it populates the model with integrated data and brings the solution back to the client. When data are available on the server, it generates the code to populate the model on the server. You can retrieve the final solution afterward.

Platforms

sasoptpy can be used with SAS Viya 3.3 or later and SAS 9.4, in all the supported operating systems.

1.1.2 Road Map

The goal of sasoptpy is to support all the functionality of the SAS Optimization and SAS/OR solvers and provide a high-level set of tools for easily working with models.

1.1.3 Versioning

sasoptpy follows [Semantic Versioning](#) as of version 1.0.0.

- Any backward incompatible changes increase the major version number (X.y.z).
- Minor changes and improvements increase the the minor version number (x.Y.z).
- Patches increase the patch version number (x.y.Z).
- Pre-releases are marked by using *alpha* and *beta*, and release candidates are marked by using *rc* identifiers.

1.1.4 License

sasoptpy is an open-source package and uses the standard [Apache 2.0 license](#).

1.1.5 Support

Have any questions?

- If you have a package-related issue, feel free to report it on [GitHub](#).
- If you have an optimization-related question, consider asking it on [SAS Communities](#).
- For further technical support, contact [SAS Technical Support](#).

1.1.6 Contribution

Contributions are always welcome. Clone the project to your working environment and submit pull requests as you see fit. For more information, see the guidelines at the GitHub repository.

1.1.7 Highlighted Works

A list of highlighted projects and blog posts:

- [Fastest, cheapest, greenest: How will football fans choose which matches to attend?](#)
- [1 tournament, 12 countries: A logistical maze?](#)
- [Using SAS Optimization with Python and containers](#)
- [Bringing Analytics to the Soccer Transfer Season](#)
- [Visiting all 30 Major League Baseball Stadiums - with Python and SAS Viya](#)

1.2 What's New

1.2.1 New Features

- Added workspaces; for more information, see *Workspaces in User Guide* and *Efficiency Analysis example*
- Added *package configurations*
- Added *abstract actions* that allow server-side operations. Highlights include:
 - `actions.read_data()` and `actions.create_data()`
 - `actions.for_loop()` and `actions.cofor_loop()`
 - `actions.print_item()`
 - `actions.solve()`
- Added structure decorators for better control of submissions

1.2.2 Changes

- Refactored the entire package; sasoptpy now has *core*, *abstract*, *interface*, *session*, and *util* directories
- Experimental RESTful API was dropped
- `get_obj_by_name` function was removed
- *lso* solver was renamed *blackbox*
- Because of the use of literal strings ([PEP 498](#)), only Python 3.6 or later versions are supported

1.2.3 Bug Fixes

- Fixed: Arithmetic operations with powers are generating incorrect results
- Fixed: Variable groups with space in their index are not getting values
- Fixed: Constraints without directions do not produce an error
- Fixed: Documentation does not mention conda-forge library requirement
- Fixed: Single-dimensional parameters are hard to access

1.3 License

Apache License
Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

(continues on next page)

(continued from previous page)

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable

(continues on next page)

(continued from previous page)

copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or

(continues on next page)

(continued from previous page)

for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

INSTALLATION

2.1 Python Version Support and Dependencies

Current version is developed and tested for Python 3.6 and later.

It requires the following packages:

- NumPy
- SASPy
- SWAT
- pandas

2.2 Getting sasoptpy

You can install sasoptpy by using *pip* or *conda*:

```
pip install sasoptpy  
conda install -c sas-institute sasoptpy
```

Any dependencies are installed automatically.

Depending on your installation, you might need to add the *conda-forge* channel to *conda*:

```
conda config --append channels conda-forge
```

2.2.1 GitHub repository

You can also get stable and development versions of sasoptpy from the GitHub repository. To get the latest version, call:

```
git clone https://github.com/sassoftware/sasoptpy.git
```

Then inside the sasoptpy folder, call:

```
pip install .
```

Alternatively, you can use:

```
python setup.py install
```

3.1 Introduction to Optimization

Optimization is an umbrella term for maximizing or minimizing a specified target; given as a mathematical function. Optimization is often used in real-life problems from finance to aviation, from chemistry to sports analytics.

Optimization problems can describe a business problem or a physical concept. Any phenomenon that can be represented as a function can be optimized by several algorithms. Optimization lies at the heart of several tools you use every day, from routing to machine learning.

3.1.1 Steps of Optimization

Optimization problems often consist of the following steps:^{1,2}

1. Observe the system and define the problem.
2. Gather relevant data.
3. Develop a formulation.
4. Solve the model.
5. Interpret the solution.

A modeler observes the process in order to identify the problems and potential improvements. Several examples of optimization problems are finding the shortest path between two locations, maximizing a profit, and maximizing the accuracy of a handwriting recognition algorithm.

Collecting data is often the most daunting process. In the age of big data, it is often difficult to distinguish noise from relevant data. After data are gathered, you can write a formulation. A proper formulation is critical because features such as linearity and convexity greatly impact the performance of solution algorithms, especially for large problems.

Solving a problem requires an optimization algorithm. SAS Optimization provides several optimization algorithms to solve a variety of different problem types. For more information, see *Types of Optimization*.

Finally, the modeler decides whether the result of an optimization process is valid. If not, the process is repeated by adding the missing pieces until a satisfactory result is obtained.

¹ Hillier, Frederick S., and Gerald J. Lieberman. Introduction to operations research. McGraw-Hill Science, Engineering & Mathematics, 1995.

² SAS Institute. SAS/OR 15.1 User's Guide: Mathematical Programming Examples. SAS institute, 2018.

3.1.2 Basic Elements

An optimization formulation has the following elements:

- *Variables* are parameters that the optimization algorithm tunes. An optimization algorithm determines optimal values for variables in the problem. As an example, in an optimization problem of finding a route from your home to the airport, which roads to use are decision variables.
- An *objective* is a performance measure that is to be maximized or minimized. An objective is a function of variables in an optimization problem, meaning an objective value is obtained for specified values of variables. In the home to airport route example, the objective function is the time to reach the airport. The optimization algorithm decides which roads to use in order to minimize the travel time.
- *Constraints* are restrictions on variables that are added in order to prevent illogical or undesired solutions. In the example, the amount of fuel in the car restricts how far you can drive. You can the force optimization algorithm to find a solution under a certain mileage, even if there are other solutions that might be shorter in terms of travel time.

In short, *optimization* consists of choosing *variable* values to maximize or minimize an *objective* function subject to certain *constraints*.

3.1.3 Simple Problem

Consider a simple example. The following problem (brewer's dilemma) is a simplified resource allocation problem, presented by Robert G. Bland.³

In the problem, a brewer has limited corn, hops, and barley malt inventory. The brewer wants to produce ale and beer that will maximize the total profit. Each product requires a certain amount of these three ingredients, as follows:

(per barrel)	Amount Required			
Product	Corn (Pounds)	Hops (Ounces)	Barley Malt (Pounds)	Profit (\$)
Ale	5	4	35	13
Beer	15	4	20	23
(Total Available)	480	160	1,190	

The variables (*ale* and *beer*) in this problem are the number of barrels of ale and beer to produce. It might be intuitive to prefer beer to ale because of its higher profit rate. However, doing so might deplete all the resources faster and might leave you with an excess amount of hops and barley malt.

The objective in this problem is to maximize the total profit function, which is $13 \times \text{ale} + 23 \times \text{beer}$.

Each limitation on ingredients is a constraint. For corn, hops, and barley malt, the following constrains apply:

$$5 \times \text{ale} + 15 \times \text{beer} \leq 480$$

$$4 \times \text{ale} + 4 \times \text{beer} \leq 160$$

$$35 \times \text{ale} + 20 \times \text{beer} \leq 1,190$$

Combining all items, the optimization formulation is written as follows:

$$\begin{array}{llll} \text{maximize:} & 13 \times \text{ale} & + 23 \times \text{beer} & \\ \text{subject to:} & & & \\ & 5 \times \text{ale} & + 15 \times \text{beer} & \leq 480 \\ & 4 \times \text{ale} & + 4 \times \text{beer} & \leq 160 \\ & 35 \times \text{ale} & + 20 \times \text{beer} & \leq 1,190 \\ & \text{ale} & & \geq 0 \\ & \text{beer} & & \geq 0 \end{array}$$

³ Bland, Robert G. "The Allocation of Resources by Linear Programming." Scientific American 244 (1981): 126-144.

This problem is small enough to be solved by hand, but consider some alternatives.

	Barrels Produced		
#	Ale	Beer	Profit (\$)
1	34	0	442
2	0	32	736
3	15	25	770
4	12	28	800

The preceding table indicates that producing only ale or beer creates less profit than producing a combination of the two. Alternative solution 4 gives the optimal values that maximize the profit in this example.

Following are additional examples of problems that can be formulated as optimization problems:

- scheduling project steps to minimize total completion time, where some tasks might depend on completion of earlier tasks
- choosing distribution centers for retailers to minimize total cost while satisfying customer demands on delivery time
- assigning soccer players to a squad to maximize the total rating of the team under foreign player rules
- finding the cheapest travel option and shortest route between two cities
- blending chemical products to minimize the total cost while achieving a certain efficiency of detergents
- choosing a price that will maximize the total profit in a competitive market

For more information about optimization problems and examples, see the related section of [SAS Optimization Mathematical Optimization Procedures](#).

3.1.4 Types of Optimization

The structure of a formulation affects which algorithms can be deployed to solve a problem. The most common optimization types are as follows:

- **Linear optimization:** If the objective function and all constraints of a problem can be described by linear mathematical relations and if all decision variables are continuous, the formulation is called a linear problem (LP). LPs are among the easiest problems in terms of solution time and are well-studied in literature.
- **Mixed integer linear optimization:** If a linear formulation involves binary (yes or no type decisions), or integer variables, the problem is an integer linear problem (ILP) or mixed integer linear problem (MILP), depending on the variables. MILPs are very popular as many real-life problems can be represented as MILPs.
- **Nonlinear optimization:** If a problem involves nonlinear objectives or constraints (such as exponential, polynomial, or absolute values), the problem is called a nonlinear problem (NLP).

3.2 Quick Reference

This is a short introduction to sasoptpy functionality, mainly for new users. You can find more details in the linked chapters.

Using sasoptpy usually consists of the following steps:

1. Create a *CAS session* or a *SAS session*
2. Initialize the *model*

3. Process the *input data*
4. Add the *model components*
5. *Solve the model*

Solving an optimization problem via sasoptpy starts with having a running CAS (SAS Viya) Server or having a SAS 9.4 installation. It is possible to model a problem without a connection but solving a problem requires access to SAS Optimization or SAS/OR solvers at runtime.

3.2.1 Creating a session

Creating a SAS Viya session

To create a SAS Viya session (also called a CAS session), see [SWAT documentation](#). A simple connection can be made using:

```
In [1]: from swat import CAS
In [2]: s = CAS(hostname, port, userid, password)
```

The last two parameters are optional for some use cases.

Creating a SAS 9.4 session

To create a SAS 9.4 session (also called a SAS session), see [SASPy documentation](#). After customizing the configurations for your setup, you can create a session as follows:

```
import saspy
s = saspy.SASsession(cfgname='winlocal')
```

3.2.2 Initializing a model

After creating a CAS or SAS session, you can create an empty model as follows:

```
In [3]: import sasoptpy as so
In [4]: m = so.Model(name='my_first_model', session=s)
NOTE: Initialized model my_first_model.
```

This command initializes the optimization model as a *Model* object, called *m*.

3.2.3 Processing input data

The easiest way to work with sasoptpy is to define problem inputs as pandas DataFrames. You can define objective and cost coefficients, and lower and upper bounds by using the DataFrame and Series objects, respectively. See [pandas documentation](#) to learn more.

```
In [5]: import pandas as pd
In [6]: prob_data = pd.DataFrame([
...:     ['Period1', 30, 5],
...:     ['Period2', 15, 5],
```

(continues on next page)

(continued from previous page)

```

....:      ['Period3', 25, 0]
....:      ], columns=['period', 'demand', 'min_prod']).set_index(['period'])
....:

In [7]: price_per_product = 10

In [8]: capacity_cost = 10

```

You can refer the set PERIODS and the other fields demand and min_production as follows:

```

In [9]: PERIODS = prob_data.index.tolist()

In [10]: demand = prob_data['demand']

In [11]: min_production = prob_data['min_prod']

```

3.2.4 Adding variables

You can add a single variable or a set of variables to *Model* objects.

- *Model.add_variable()* method is used to add a single variable.

```

In [12]: production_cap = m.add_variable(vartype=so.INT, name='production_cap',
↳ lb=0)

```

When working with multiple models, you can create a variable independent of the model, such as

```
>>> production_cap = so.Variable(name='production_cap', vartype=so.INT, lb=0)
```

Then you can add it to an existing model by using *Model.include()*:

```
>>> m.include(production_cap)
```

- *Model.add_variables()* method is used to add a set of variables.

```

In [13]: production = m.add_variables(PERIODS, vartype=so.INT, name='production',
....:                                lb=min_production)
....:

```

When the input is a set of variables, you can retrieve individual variables by using individual keys, such as `production['Period1']`. To create multidimensional variables, simply list all the keys as follows:

```
>>> multivar = m.add_variables(KEYS1, KEYS2, KEYS3, name='multivar')
```

3.2.5 Creating expressions

Expression objects hold mathematical expressions. Although these objects are mostly used under the hood when defining a model, it is possible to define a custom *Expression* to use later.

When *Variable* objects are used in a mathematical expression, sasoptpy creates an *Expression* object automatically:

```
In [14]: totalRevenue = production.sum('*')*price_per_product
In [15]: totalCost = production_cap * capacity_cost
```

Note the use of the `VariableGroup.sum()` method over a variable group. This method returns the sum of variables inside the group as an `Expression` object. Its multiplication with a scalar `price_per_product` gives the final expression.

Similarly, `totalCost` is simply multiplication of a `Variable` object with a scalar.

3.2.6 Setting an objective function

You can define objective functions in terms of expressions. In this problem, the objective is to maximize the profit, so the `Model.set_objective()` method is used as follows:

```
In [16]: m.set_objective(totalRevenue-totalCost, sense=so.MAX, name='totalProfit')
Out [16]: sasoptpy.Expression(exp = 10 * production[Period1] + 10 *
↳ production[Period2] + 10 * production[Period3] - 10 * production_cap, name=
↳ 'totalProfit')
```

Notice that you can define the same objective by using:

```
>>> m.set_objective(production.sum('*')*price_per_product - production_cap*capacity_
↳ cost, sense=so.MAX, name='totalProfit')
```

The mandatory argument `sense` should be assigned the value of either `so.MIN` for a minimization problem or `so.MAX` for a maximization problems.

3.2.7 Adding constraints

In `sasoptpy`, constraints are simply expressions that have a direction. It is possible to define an expression and add it to a model by defining which direction the linear relation should have.

There are two methods to add constraints. The first is `Model.add_constraint()`, which adds a single constraint to a model.

The second is `Model.add_constraints()`, which adds multiple constraints to a model.

```
In [17]: m.add_constraints((production[i] <= production_cap for i in PERIODS),
.....:                    name='capacity')
.....:
Out [17]: sasoptpy.ConstraintGroup([production[Period1] - production_cap <= 0,
↳ production[Period2] - production_cap <= 0, production[Period3] - production_cap <=
↳ 0], name='capacity')
```

```
In [18]: m.add_constraints((production[i] <= demand[i] for i in PERIODS),
.....:                    name='demand')
.....:
Out [18]: sasoptpy.ConstraintGroup([production[Period1] <= 30, production[Period2] <=
↳ 15, production[Period3] <= 25], name='demand')
```

The first term, provides a Python generator, which is then translated into constraints in the problem. The symbols `<=`, `>=`, and `==` are used for less than or equal to, greater than or equal to, and equal to, respectively. You can define range constraints by using the `==` symbol followed by a list of two values that represent lower and upper bounds.

```
In [19]: m.add_constraint(production['Period1'] == [10, 100], name='production_bounds
↳')
Out[19]: sasoptpy.Constraint(production[Period1] == [10, 100], name='production_
↳bounds')
```

3.2.8 Solving a problem

After a problem is defined, you can send it to the CAS server or SAS session by calling the `Model.solve()` method, which returns the primal solution when it is available, and `None` otherwise.

```
In [20]: m.solve()
NOTE: Added action set 'optimization'.
NOTE: Converting model my_first_model to OPTMODEL.
NOTE: Submitting OPTMODEL code to CAS server.
NOTE: Problem generation will use 8 threads.
NOTE: The problem has 4 variables (0 free, 0 fixed).
NOTE: The problem has 0 binary and 4 integer variables.
NOTE: The problem has 7 linear constraints (6 LE, 0 EQ, 0 GE, 1 range).
NOTE: The problem has 10 linear constraint coefficients.
NOTE: The problem has 0 nonlinear constraints (0 LE, 0 EQ, 0 GE, 0 range).
NOTE: The OPTMODEL presolver is disabled for linear problems.
NOTE: The initial MILP heuristics are applied.
NOTE: The MILP presolver value AUTOMATIC is applied.
NOTE: The MILP presolver removed all variables and constraints.
NOTE: Optimal.
NOTE: Objective = 400.
NOTE: The output table 'SOLUTION' in caslib 'CASUSER(casuser)' has 4 rows and 6_
↳columns.
NOTE: The output table 'DUAL' in caslib 'CASUSER(casuser)' has 7 rows and 4 columns.
NOTE: The CAS table 'solutionSummary' in caslib 'CASUSER(casuser)' has 18 rows and 4_
↳columns.
NOTE: The CAS table 'problemSummary' in caslib 'CASUSER(casuser)' has 20 rows and 4_
↳columns.
Out[20]:
Selected Rows from Table SOLUTION
```

	i	var	value	lb	ub	rc
0	1.0	production_cap	25.0	-0.0	1.797693e+308	NaN
1	2.0	production[Period1]	25.0	5.0	1.797693e+308	NaN
2	3.0	production[Period2]	15.0	5.0	1.797693e+308	NaN
3	4.0	production[Period3]	25.0	-0.0	1.797693e+308	NaN

At the end of the solve operation, the solver returns a “Problem Summary” table and a “Solution Summary” table. These tables can later be accessed by using `m.get_problem_summary()` and `m.get_solution_summary()`.

```
In [21]: print(m.get_solution_summary())
Selected Rows from Table SOLUTIONSUMMARY
```

	Value
Label	
Solver	MILP
Algorithm	Branch and Cut
Objective Function	totalProfit
Solution Status	Optimal

(continues on next page)

(continued from previous page)

Objective Value	400
Relative Gap	0
Absolute Gap	0

Solutions Found	3
Iterations	0
Presolve Time	0.00
Solution Time	0.01

3.2.9 Printing solutions

You can retrieve the solutions by using the `get_solution_table()` method. It is strongly suggested that you group variables and expressions that share the same keys in a call.

```
In [22]: print(so.get_solution_table(demand, production))
          demand  production
period
Period1      30         25.0
Period2      15         15.0
Period3      25         25.0
```

3.2.10 Initializing a workspace

If you want to use the extensive abstract modeling capabilities of sasoptpy, you can create a workspace. Workspaces support features such as server-side for loops, cofor loops (parallel), reading and creating CAS tables. You can initialize a *Workspace* by using Python's `with` keyword. For example, you can create a workspace that has a set and a variable group as follows:

```
In [23]: def create_workspace():
...:     with so.Workspace(name='my_workspace', session=s) as w:
...:         I = so.Set(name='I', value=range(1, 11))
...:         x = so.VariableGroup(I, name='x', lb=0)
...:         return w
...:
```

```
In [24]: workspace = create_workspace()
```

```
In [25]: print(so.to_optmodel(workspace))
proc optmodel;
    set I = 1..10;
    var x {{I}} >= 0;
quit;
```

You can submit a workspace to a CAS server and retrieve the response by using:

```
In [26]: workspace.submit()
NOTE: Added action set 'optimization'.
NOTE: The output table 'SOLUTION' in caslib 'CASUSER(casuser)' has 10 rows and 6_
↪columns.
NOTE: The output table 'DUAL' in caslib 'CASUSER(casuser)' has 0 rows and 4 columns.
Out[26]:
Selected Rows from Table SOLUTION
```

	i	var	value	lb	ub	rc
0	1.0	x[1]	0.0	0.0	1.797693e+308	NaN
1	2.0	x[2]	0.0	0.0	1.797693e+308	NaN
2	3.0	x[3]	0.0	0.0	1.797693e+308	NaN
3	4.0	x[4]	0.0	0.0	1.797693e+308	NaN
4	5.0	x[5]	0.0	0.0	1.797693e+308	NaN
5	6.0	x[6]	0.0	0.0	1.797693e+308	NaN
6	7.0	x[7]	0.0	0.0	1.797693e+308	NaN
7	8.0	x[8]	0.0	0.0	1.797693e+308	NaN
8	9.0	x[9]	0.0	0.0	1.797693e+308	NaN
9	10.0	x[10]	0.0	0.0	1.797693e+308	NaN

3.2.11 Package configurations

sasoptpy comes with certain package configurations. The configuration parameters and their default values are as follows:

- verbosity (default 3)
- max_digits (default 12)
- print_digits (default 6)
- default_sense (default so.minimization)
- default_bounds
- valid_outcomes

It is possible to override these configuration parameters. As an example, consider the following constraint representation:

```
In [27]: x = so.Variable(name='x')

In [28]: c = so.Constraint(10 / 3 * x + 1e-20 * x ** 2 <= 30 + 1e-11, name='c')

In [29]: print(so.to_definition(c))
con c : 3.333333333333 * x + 0.0 * ((x) ^ (2)) <= 30.000000000001;
```

You can change the number of digits to be printed as follows:

```
In [30]: so.config['max_digits'] = 2

In [31]: print(so.to_definition(c))
con c : 3.33 * x + 0.0 * ((x) ^ (2)) <= 30.0;
```

You can remove the maximum number of digits to print as follows:

```
In [32]: so.config['max_digits'] = None
```

```
In [33]: print(so.to_definition(c))
con c : 3.3333333333333335 * x + 1e-20 * ((x) ^ (2)) <= 30.000000000001;
```

You can reset the parameter to its default value by deleting the parameter:

```
In [34]: del so.config['max_digits']
```

You can also create a new configuration to be used globally:

```
In [35]: so.config['myvalue'] = 2
```

3.3 Sessions

3.3.1 CAS Sessions

A `swat.cas.connection.CAS` session is needed in order to use `sasoptpy` and SAS Optimization solvers to solve optimization problems. You can find more details about CAS sessions in [SWAT Documentation](#).

You can create a sample CAS Session as follows:

```
>>> import sasoptpy as so
>>> from swat import CAS
>>> s = CAS(hostname=cas_host, username=cas_username, password=cas_password, port=cas_
↪port)
>>> m = so.Model(name='demo', session=s)
>>> print(repr(m))
sasoptpy.Model(name='demo', session=CAS(hostname, port, username, protocol='cas',
↪name='py-session-1', session=session-no))
```

You can end the session and close the connection as follows:

```
>>> s.terminate()
```

3.3.2 SAS Sessions

A `saspy.SASsession` session is needed in order to use `sasoptpy` and SAS/OR solvers to solve optimization problems on SAS 9.4 clients.

You can create a sample SAS session as follows:

```
>>> import sasoptpy as so
>>> import saspy
>>> sas_session = saspy.SASsession(cfgname='winlocal')
>>> m = so.Model(name='demo', session=sas_session)
>>> print(repr(m))
sasoptpy.Model(name='demo', session=saspy.SASsession(cfgname='winlocal'))
```

You can connect to a SAS session by using a configuration file

```
In [1]: sas = saspy.SASsession(cfgfile=config_file)
Using SAS Config named: sshsas
SAS Connection established. Subprocess id is 148
```

```
In [2]: m = so.Model(name='demo', session=sas)
NOTE: Initialized model demo.
```

```
In [3]: print(m.get_session().sasver)
9.04.01M6P11072018
```

You can terminate the SAS session as follows:

```
In [4]: sas.endsas()
SAS Connection terminated. Subprocess id was 148
```

3.4 Models

3.4.1 Creating a model

You can create an empty model by using the *Model* constructor:

```
In [1]: import sasoptpy as so

In [2]: m = so.Model(name='model1')
NOTE: Initialized model model1.
```

3.4.2 Adding new components to a model

Add a variable:

```
In [3]: x = m.add_variable(name='x', vartype=so.BIN)

In [4]: print(m)
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (1): [
    x
  ]
  Constraints (0): [
  ]
]

In [5]: y = m.add_variable(name='y', lb=1, ub=10)

In [6]: print(m)
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (0): [
  ]
]
```

Add a constraint:

```
In [7]: c1 = m.add_constraint(x + 2 * y <= 10, name='c1')

In [8]: print(m)
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]
```

3.4.3 Adding existing components to a model

A new model can use existing variables. The typical way to include a variable is to use the `Model.include()` method:

```
In [9]: new_model = so.Model(name='new_model')
NOTE: Initialized model new_model.

In [10]: new_model.include(x, y)

In [11]: print(new_model)
Model: [
  Name: new_model
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (0): [
  ]
]

In [12]: new_model.include(c1)

In [13]: print(new_model)
Model: [
  Name: new_model
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]

In [14]: z = so.Variable(name='z', vartype=so.INT, lb=3)
```

(continues on next page)

(continued from previous page)

```
In [15]: new_model.include(z)

In [16]: print(new_model)
Model: [
  Name: new_model
  Objective: MIN [0]
  Variables (3): [
    x
    y
    z
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]
```

Note that variables are added to *Model* objects by reference. Therefore, after *Model.solve()* is called, the values of variables are replaced with optimal values.

3.4.4 Accessing components

You can access a list of model variables by using the *Model.get_variables()* method:

```
In [17]: print(m.get_variables())
[sasoptpy.Variable(name='x', lb=0, ub=1, vartype='BIN'), sasoptpy.Variable(name='y',
↳ lb=1, ub=10, vartype='CONT')]
```

Similarly, you can access a list of constraints by using the *Model.get_constraints()* method:

```
In [18]: c2 = m.add_constraint(2 * x - y >= 1, name='c2')

In [19]: print(m.get_constraints())
[sasoptpy.Constraint(x + 2 * y <= 10, name='c1'), sasoptpy.Constraint(2 * x - y >=
↳ 1, name='c2')]
```

To access a certain constraint by using its name, you can use the *Model.get_constraint()* method:

```
In [20]: print(m.get_constraint('c2'))
2 * x - y >= 1
```

3.4.5 Dropping components

You can drop a variable inside a model by using *Model.drop_variable()* method. Similarly, you can drop a set of variables by using the *Model.drop_variables()* method.

```
In [21]: m.drop_variable(y)

In [22]: print(m)
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (1): [
    x
  ]
]
```

(continues on next page)

(continued from previous page)

```
]
Constraints (2): [
    x + 2 * y <= 10
    2 * x - y >= 1
]
]
```

You can drop a constraint by using the `Model.drop_constraint()` method. Similarly, you can drop a set of constraints by using the `Model.drop_constraints()` method.

```
In [23]: m.drop_constraint(c1)
```

```
In [24]: m.drop_constraint(c2)
```

```
In [25]: print(m)
```

```
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (0): [
  ]
]
```

```
In [26]: m.include(c1)
```

```
In [27]: print(m)
```

```
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]
```

3.4.6 Copying a model

You can copy an existing model by including the `Model` object itself.

```
In [28]: copy_model = so.Model(name='copy_model')
```

```
NOTE: Initialized model copy_model.
```

```
In [29]: copy_model.include(m)
```

```
In [30]: print(copy_model)
```

```
Model: [
  Name: copy_model
  Objective: MIN [0]
]
```

(continues on next page)

(continued from previous page)

```

Variables (2): [
    x
    y
]
Constraints (1): [
    x + 2 * y <= 10
]
]

```

Note that all variables and constraints are included by reference.

3.4.7 Solving a model

A model is solved by using the `Model.solve()` method. This method converts Python definitions into an MPS file and uploads it to a CAS server for the optimization action. The type of the optimization problem is determined according to the variable types and expressions.

```

>>> m.solve()
NOTE: Initialized model model_1
NOTE: Converting model model_1 to DataFrame
NOTE: Added action set 'optimization'.
...
NOTE: Optimal.
NOTE: Objective = 124.343.
NOTE: The Dual Simplex solve time is 0.01 seconds.

```

3.4.8 Solve options

Solver Options

You can pass either solve options from the OPTMODEL procedure or solve parameter from the `solveLp` and `solveMilp` actions by using the `options` parameter of the `Model.solve()` method.

```

>>> m.solve(options={'with': 'milp', 'maxtime': 600})
>>> m.solve(options={'with': 'lp', 'algorithm': 'ipm'})

```

The parameter `with` is used to specify the optimization solver in OPTMODEL procedure. If the `with` parameter is not passed, PROC OPTMODEL chooses a solver that depends on the problem type. Possible `with` values are listed in the [SAS/OR documentation](#).

You can find specific solver options in the SAS Optimization documentation:

- [LP solver options](#)
- [MILP solver options](#)
- [NLP solver options](#)
- [QP solver options](#)
- [Black-box solver options](#) (formerly called LSO solver)

The `options` parameter can also pass `solveLp` and `solveMilp` action parameter when `frame=True` is used when the `Model.solve()` method is called.

- [solveLp options](#)

- `solveMilp` options

Call parameters

Besides the `options` parameter, you can pass following parameters into the `Model.solve()` method:

- `name`: Name of the uploaded problem information
- `drop`: Drops the data from server after the solve
- `replace`: Replaces an existing data with the same name
- **primalin**: Uses the current values of the variables as an initial solution. When the value of this parameter is `True`, the solve method grabs `Variable` objects' `_init` fields. You can modify this field by using the `Variable.set_init()` method.
- `submit`: Calls the CAS action or SAS procedure
- `frame`: Uses the frame (MPS) method. If the value of this parameter is `False`, then the method uses OPT-MODEL codes.
- `verbose`: Prints the generated PROC OPTMODEL code or MPS DataFrame object before the solve

3.4.9 Getting solutions

After the solve is completed, all variable and constraint values are parsed automatically. You can access a summary of the problem by using the `Model.get_problem_summary()` method, and a summary of the solution by using the `Model.get_solution_summary()` method.

To print the values of any object, you can use the `get_solution_table()` method:

```
>>> print(so.get_solution_table(x, y))
```

All variables and constraints that are passed into this method are returned on the basis of their indices. See [Examples](#) for more details.

3.4.10 Tuning MILP model parameters

SAS Optimization solvers provide a variety of settings. However, it might be difficult to find the best settings for a particular model. In order to compare parameters and make a good choice, you can use the `optimization.tune` action for mixed integer linear optimization problems.

The `Model.tune_parameters()` method is a wrapper for the `tune` action. Consider the following knapsack problem example:

```
In [31]: def get_model():
.....:     m = so.Model(name='knapsack_with_tuner', session=cas_conn)
.....:     data = [
.....:         ['clock', 8, 4, 3],
.....:         ['mug', 10, 6, 5],
.....:         ['headphone', 15, 7, 2],
.....:         ['book', 20, 12, 10],
.....:         ['pen', 1, 1, 15]
.....:     ]
.....:     df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit']).set_
↳ index(['item'])
.....:     ITEMS = df.index
```

(continues on next page)

(continued from previous page)

```

.....: value = df['value']
.....: weight = df['weight']
.....: limit = df['limit']
.....: total_weight = 55
.....: get = m.add_variables(ITEMS, name='get', vartype=so.INT)
.....: m.add_constraints((get[i] <= limit[i] for i in ITEMS), name='limit_con')
.....: m.add_constraint(so.expr_sum(weight[i] * get[i] for i in ITEMS) <= total_
↳weight, name='weight_con')
.....: total_value = so.expr_sum(value[i] * get[i] for i in ITEMS)
.....: m.set_objective(total_value, name='total_value', sense=so.MAX)
.....: return m
.....:

```

In [32]: m = get_model()

NOTE: Initialized model knapsack_with_tuner.

For this problem, you can compare configurations as follows:

In [33]: results = m.tune_parameters(tunerParameters={'maxConfigs': 10})

NOTE: Added action set 'optimization'.

NOTE: Uploading the problem DataFrame to the server.

NOTE: Cloud Analytic Services made the uploaded file available as table KNAPSACK_WITH_TUNER in caslib CASUSER(casuser).

NOTE: The table KNAPSACK_WITH_TUNER has been created in caslib CASUSER(casuser) from binary data uploaded to Cloud Analytic Services.

NOTE: Start to tune the MILP

`Model.tune_parameters()` accepts three main arguments

- `milpParameters`
- `tunerParameters`
- `tuningParameters`

For a full set of tuning parameters and acceptable values of these arguments, see the [SAS Optimization documentation](#).

For the example problem, you can tune the *presolver*, *cutStrategy*, and *strongIter* settings, by using initial values and candidate values, and limit the maximum number of configurations and maximum running time as follows:

```
In [35]: results = m.tune_parameters(
.....:     milpParameters={'maxtime': 10},
.....:     tunerParameters={'maxConfigs': 20, 'logfreq': 5},
.....:     tuningParameters=[
.....:         {'option': 'presolver', 'initial': 'none', 'values': ['basic',
→ 'aggressive', 'none']},
.....:         {'option': 'cutStrategy'},
.....:         {'option': 'strongIter', 'initial': -1, 'values': [-1, 100, 1000]}
.....:     ])
.....:
```

NOTE: Added action set 'optimization'.

NOTE: Uploading the problem DataFrame to the server.

3.5 Model Components

In this section, several model components are discussed with examples. See [Examples](#) to learn more about how you can use these components to define optimization models.

3.5.1 Expressions

Expression objects represent linear and nonlinear mathematical expressions in sasoptpy.

Creating expressions

You can create an *Expression* object as follows:

```
In [1]: profit = so.Expression(5 * sales - 3 * material, name='profit')

In [2]: print(repr(profit))
sasoptpy.Expression(exp = 5 * sales - 3 * material, name='profit')
```

Nonlinear expressions

Expression objects are linear by default. It is possible to create nonlinear expressions, but there are some limitations.

```
In [3]: nonexp = sales ** 2 + (1 / material) ** 3

In [4]: print(nonexp)
(sales) ** (2) + ((1) / (material)) ** (3)
```

Currently, it is not possible to get or print values of nonlinear expressions. Moreover, if your model includes a nonlinear expression, you need to use SAS Viya 3.4 or later or any SAS/OR release for solving your problem.

To use mathematical operations, you need to import *sasoptpy.math* functions.

Mathematical expressions

sasoptpy provides mathematical functions for generating mathematical expressions to be used in optimization models.

You need to import *sasoptpy.math* into your code to use these functions. Available mathematical functions are listed in [Math Functions](#).

```
In [5]: import sasoptpy.math as sm

In [6]: newexp = sm.max(sales, 10) ** 2

In [7]: print(newexp._expr())
(max(sales , 10)) ^ (2)

In [8]: import sasoptpy.math as sm

In [9]: angle = so.Variable(name='angle')

In [10]: newexp = sm.sin(angle) ** 2 + sm.cos(angle) ** 2
```

(continues on next page)

(continued from previous page)

```
In [11]: print(newexp._expr())  
(sin(angle)) ^ (2) + (cos(angle)) ^ (2)
```

Operations

Getting the current value

After the solve is completed, you can obtain the current value of an expression by using the `Expression.get_value()` method:

```
>>> print(profit.get_value())  
42.0
```

Getting the dual value

You can retrieve the dual values of `Expression` objects by using `Variable.get_dual()` and `Constraint.get_dual()` methods.

```
>>> m.solve()  
>>> ...  
>>> print(x.get_dual())  
1.0
```

Addition

You can add, subtract, multiply and divide components using regular Python functionality:

```
In [12]: tax = 0.5
```

```
In [13]: profit_after_tax = profit - tax
```

```
In [14]: print(repr(profit_after_tax))  
sasoptpy.Expression(exp = 5 * sales - 3 * material - 0.5, name=None)
```

```
In [15]: share = 0.2 * profit
```

```
In [16]: print(share)  
sales - 0.6 * material
```

Summation

For faster summations compared to Python's native `sum` function, sasoptpy provides `expr_sum()` (formerly `quick_sum()`)

```
In [17]: import time
```

```
In [18]: x = m.add_variables(1000, name='x')
```

```
In [19]: t0 = time.time()
```

```
In [20]: e = so.expr_sum(2 * x[i] for i in range(1000))
```

```
In [21]: print(time.time()-t0)  
0.031841278076171875
```

```
In [22]: t0 = time.time()

In [23]: f = sum(2 * x[i] for i in range(1000))

In [24]: print(time.time()-t0)
0.9445626735687256
```

Renaming an expression

You can rename expressions by using the `Expression.set_name()` method:

```
In [25]: e = so.Expression(x[5] + 2 * x[6], name='e1')

In [26]: print(repr(e))
sasoptpy.Expression(exp = x[5] + 2 * x[6], name='e1')

In [27]: e.set_name('e2');

In [28]: print(repr(e))
sasoptpy.Expression(exp = x[5] + 2 * x[6], name='e2')
```

Copying an expression

You can copy an `Expression` by using the `Expression.copy()` method:

```
In [29]: copy_profit = profit.copy(name='copy_profit')

In [30]: print(repr(copy_profit))
sasoptpy.Expression(exp = 5 * sales - 3 * material, name='copy_profit')
```

3.5.2 Objective Functions

Setting and getting an objective function

You can use any valid `Expression` as the objective function of a model. You can also use an existing expression as an objective function by using the `Model.set_objective()` method. The objective function of a model can be obtained by using the `Model.get_objective()` method.

```
>>> profit = so.Expression(5 * sales - 2 * material, name='profit')
>>> m.set_objective(profit, so.MAX)
>>> print(m.get_objective())
- 2.0 * material + 5.0 * sales
```

Getting the value

After a solve, you can retrieve the objective value by using the `Model.get_objective_value()` method.

```
>>> m.solve()
>>> print(m.get_objective_value())
42.0
```

3.5.3 Variables

Creating variables

You can create variables either stand-alone or inside a model.

Creating a variable outside a model

The first way to create a variable uses the default constructor:

```
>>> x = so.Variable(vartype=so.INT, ub=5, name='x')
```

When a variable is created separately, it needs to be included (or added) inside the model:

```
>>> y = so.Variable(name='y', lb=5)
>>> m.add_variable(y)
```

Equivalently, you could do this in one step:

```
>>> y = m.add_variable(name='y', lb=5)
```

Creating a variable inside a model

The second way is to use `Model.add_variable()`. This method creates a `Variable` object and returns a pointer.

```
>>> x = m.add_variable(vartype=so.INT, ub=5, name='x')
```

Arguments

There are three types of variables: continuous variables, integer variables, and binary variables. Continuous variables are the default type, which you can specify by using the `vartype=so.CONT` argument. You can create integer variables and binary variables by using the `vartype=so.INT` and `vartype=so.BIN` arguments, respectively.

The default lower bound for variables is 0, and the upper bound is infinity. Name is a required argument.

Changing bounds

The `Variable.set_bounds()` method changes the bounds of a variable.

```
>>> x = so.Variable(name='x', lb=0, ub=20)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=0, ub=20, vartype='CONT')
>>> x.set_bounds(lb=5, ub=15)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=5, ub=15, vartype='CONT')
```

Setting initial values

You can pass the initial values of variables to the solvers for certain problems. The `Variable.set_init()` method changes the initial value for variables. You can set also this value at the creation of the variable.

```
>>> x.set_init(5)
>>> print(repr(x))
sasoptpy.Variable(name='x', ub=20, init=5, vartype='CONT')
```

Working with a set of variables

You can create a set of variables by using a single index or by using multiple indices. Valid index sets include list, dict, and `pandas.Index` objects. See [Handling Data](#) for more information about allowed index types.

Creating a set of variables outside a model

```
>>> production = VariableGroup(PERIODS, vartype=so.INT, name='production',
                               lb=min_production)
>>> print(repr(production))
sasoptpy.VariableGroup(['Period1', 'Period2', 'Period3'], name='production')
>>> m.include(production)
```

Creating a set of variables inside a model

```
>>> production = m.add_variables(PERIODS, vartype=so.INT,
                                name='production', lb=min_production)
>>> print(production)
>>> print(repr(production))
Variable Group (production) [
  [Period1: production['Period1'],]
  [Period2: production['Period2'],]
  [Period3: production['Period3'],]
]
sasoptpy.VariableGroup(['Period1', 'Period2', 'Period3'],
name='production')
```

3.5.4 Constraints

Creating constraints

Similar to `Variable` objects, you can create `Constraint` objects inside or outside optimization models.

Creating a constraint outside a model

```
>>> c1 = so.Constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
```

Creating a constraint inside a model

```
>>> c1 = m.add_constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
```

Modifying variable coefficients

You can update the coefficient of a variable inside a constraint by using the `Constraint.update_var_coef()` method:

```
>>> c1 = so.Constraint(exp=3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
>>> c1.update_var_coef(x, -1)
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y - x <= 10, name='c1')
```

Working with a set of constraints

You can add a set of constraints by using a single index or by using multiple indices. Valid index sets include list, dict, and `pandas.Index` objects. See [Handling Data](#) for more information about allowed index types.

Creating a set of constraints outside a model

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> cg = so.ConstraintGroup((2 * z[i, j] + 3 * z[i-1, j] >= 2 for i in
                             [1] for j in ['a', 'b', 'c']), name='cg')
>>> print(cg)
Constraint Group (cg) [
  [(1, 'a'): 3.0 * z[0, 'a'] + 2.0 * z[1, 'a'] >= 2]
  [(1, 'b'): 3.0 * z[0, 'b'] + 2.0 * z[1, 'b'] >= 2]
  [(1, 'c'): 2.0 * z[1, 'c'] + 3.0 * z[0, 'c'] >= 2]
]
```

Creating a set of constraints inside a model

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> cg2 = m.add_constraints((2 * z[i, j] + 3 * z[i-1, j] >= 2 for i in
                             [1] for j in ['a', 'b', 'c']), name='cg2')
>>> print(cg2)
Constraint Group (cg2) [
  [(1, 'a'): 2.0 * z[1, 'a'] + 3.0 * z[0, 'a'] >= 2]
  [(1, 'b'): 3.0 * z[0, 'b'] + 2.0 * z[1, 'b'] >= 2]
  [(1, 'c'): 2.0 * z[1, 'c'] + 3.0 * z[0, 'c'] >= 2]
]
```

Range constraints

You can give a range for an expression by using a list of two values (lower and upper bound) after an `==` sign:

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> c1 = m.add_constraint(x + 2*y == [2, 9], name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( x + 2.0 * y == [2, 9], name='c1')
```

3.6 Workspaces

One of the most powerful features of SAS Optimization and PROC OPTMODEL is the ability to combine several optimization models in a single call. You can read a common data set once, or parallelize solve steps for similar subproblems by using this ability.

The newly introduced *Workspace* provides this ability in a familiar syntax. Compared to *Model* objects, a *Workspace* can consist of several models and can use server-side data and OPTMODEL statements in a more detailed way.

You can create several models in the same workspace, and you can solve problems sequentially and concurrently. All the statements are sent to the server after *Workspace.submit()* is called.

3.6.1 Creating a workspace

A *Workspace* should be called by using the `with` Python keyword as follows:

```
>>> with so.Workspace('my_workspace') as w:
>>> ...
```

3.6.2 Adding components

Unlike *Model* objects, whose components are added explicitly, objects that are defined inside a *Workspace* are added automatically.

For example, adding a new variable is performed as follows:

```
In [1]: with so.Workspace(name='my_workspace') as w:
...:     x = so.Variable(name='x', vartype=so.integer)
...:
```

You can display contents of a workspace by using the *Workspace.to_optmodel()* method:

```
In [2]: print(w.to_optmodel())
proc optmodel;
  var x integer;
quit;
```

In the following example, data are loaded into the server and a problem is solved by using a workspace:

1. Create CAS session:

```
In [3]: import os

In [4]: hostname = os.getenv('CASHOST')

In [5]: port = os.getenv('CASPORT')

In [6]: from swat import CAS

In [7]: cas_conn = CAS(hostname, port)

In [8]: import sasoptpy as so

In [9]: import pandas as pd
```

2. Upload data:

```
In [10]: def send_data():
.....:     data = [
.....:         ['clock', 8, 4, 3],
.....:         ['mug', 10, 6, 5],
.....:         ['headphone', 15, 7, 2],
.....:         ['book', 20, 12, 10],
.....:         ['pen', 1, 1, 15]
.....:     ]
.....:     df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit'])
.....:     cas_conn.upload_frame(df, casout={'name': 'mydata', 'replace': True})
.....:     send_data()
.....:
```

NOTE: Cloud Analytic Services made the uploaded file available as table MYDATA in `caslib CASUSER(casuser)`.

NOTE: The table MYDATA has been created in `caslib CASUSER(casuser)` from binary data uploaded to Cloud Analytic Services.

3. Create workspace and model:

```
In [11]: from sasoptpy.actions import read_data, solve

In [12]: def create_workspace():
.....:     with so.Workspace('my_knapsack', session=cas_conn) as w:
.....:         items = so.Set(name='ITEMS', settype=so.string)
.....:         value = so.ParameterGroup(items, name='value')
.....:         weight = so.ParameterGroup(items, name='weight')
.....:         limit = so.ParameterGroup(items, name='limit')
.....:         total_weight = so.Parameter(name='total_weight', value=55)
.....:         read_data(
.....:             table='mydata', index={'target': items, 'key': ['item']},
.....:             columns=[value, weight, limit]
.....:         )
.....:         get = so.VariableGroup(items, name='get', vartype=so.integer, lb=0)
.....:         limit_con = so.ConstraintGroup((get[i] <= limit[i] for i in items),
.....:                                     name='limit_con')
.....:         weight_con = so.Constraint(
.....:             so.expr_sum(weight[i] * get[i] for i in items) <= total_weight,
.....:             name='weight_con')
.....:         total_value = so.Objective(
.....:             so.expr_sum(value[i] * get[i] for i in items), name='total_value'
.....:         ),
.....:         sense=so.maximize)
.....:         solve()
.....:         return w
.....:
```

```
In [13]: my_workspace = create_workspace()
```

4. Print content:

```
In [14]: print(so.to_optmodel(my_workspace))
proc optmodel;
  set <str> ITEMS;
  num value {ITEMS};
  num weight {ITEMS};
  num limit {ITEMS};
```

(continues on next page)

(continued from previous page)

```

num total_weight = 55;
read data mydata into ITEMS=[item] value weight limit;
var get {{ITEMS}} integer >= 0;
con limit_con {o72 in ITEMS} : get[o72] - limit[o72] <= 0;
con weight_con : total_weight - (sum {i in ITEMS} (weight[i] * get[i])) >= 0;
max total_value = sum {i in ITEMS} (value[i] * get[i]);
solve;
quit;

```

5. Submit:

```

In [15]: my_workspace.submit()
NOTE: Added action set 'optimization'.
NOTE: There were 5 rows read from table 'MYDATA' in caslib 'CASUSER(casuser)'.
NOTE: Problem generation will use 8 threads.
NOTE: The problem has 5 variables (0 free, 0 fixed).
NOTE: The problem has 0 binary and 5 integer variables.
NOTE: The problem has 6 linear constraints (5 LE, 0 EQ, 1 GE, 0 range).
NOTE: The problem has 10 linear constraint coefficients.
NOTE: The problem has 0 nonlinear constraints (0 LE, 0 EQ, 0 GE, 0 range).
NOTE: The OPTMODEL presolver is disabled for linear problems.
NOTE: The initial MILP heuristics are applied.
NOTE: The MILP presolver value AUTOMATIC is applied.
NOTE: The MILP presolver removed 0 variables and 5 constraints.
NOTE: The MILP presolver removed 5 constraint coefficients.
NOTE: The MILP presolver modified 0 constraint coefficients.
NOTE: The presolved problem has 5 variables, 1 constraints, and 5 constraint_
↪coefficients.
NOTE: The MILP solver is called.
NOTE: The parallel Branch and Cut algorithm is used.
NOTE: The Branch and Cut algorithm is using up to 8 threads.

```

4	5.0	get[pen]	5.0	-0.0	1.797693e+308	NaN

3.6.3 Abstract actions

As shown in the previous example, a *Workspace* can contain statements such as `actions.read_data()` and `actions.solve()`.

These statements are called “Abstract Statements” and are fully supported inside *Workspace* objects. These actions are performed on the server at runtime.

A list of abstract actions is available in the [API section](#).

Adding abstract actions

You can import abstract actions through `sasoptpy.actions` as follows:

```
>>> from sasoptpy.actions import read_data, create_data
```

These abstract actions are performed on the server side by generating equivalent OPTMODEL code at execution.

Retrieving results

In order to solve a problem, you need to use the `actions.solve()` function explicitly. Because *Workspace* objects allow several models and solve statements to be included, each of these solve statements is retrieved separately. You can return the solution after each solve by using the `actions.print()` function or by using the `actions.create_data()` function to create table.

In the following example, a parameter is changed and the same problem is solved twice:

1. Create workspace and components:

```
In [16]: from sasoptpy.actions import read_data, solve, print_item

In [17]: def create_multi_solve_workspace():
.....:     with so.Workspace('my_knapsack', session=cas_conn) as w:
.....:         items = so.Set(name='ITEMS', settype=so.string)
.....:         value = so.ParameterGroup(items, name='value')
.....:         weight = so.ParameterGroup(items, name='weight')
.....:         limit = so.ParameterGroup(items, name='limit')
.....:         total_weight = so.Parameter(name='total_weight', init=55)
.....:         read_data(table='mydata', index={'target': items, 'key': ['item
↪']}, columns=[value, weight, limit])
.....:         get = so.VariableGroup(items, name='get', vartype=so.integer,
↪lb=0)
.....:         limit_con = so.ConstraintGroup((get[i] <= limit[i] for i in
↪items), name='limit_con')
.....:         weight_con = so.Constraint(
.....:             so.expr_sum(weight[i] * get[i] for i in items) <= total_
↪weight, name='weight_con')
.....:         total_value = so.Objective(so.expr_sum(value[i] * get[i] for i
↪in items), name='total_value', sense=so.MAX)
.....:         s1 = solve()
.....:         p1 = print_item(get)
.....:         total_weight.set_value(40)
.....:         s2 = solve()
.....:         p2 = print_item(get)
.....:         return w, s1, p1, s2, p2
.....:
```

(continues on next page)

(continued from previous page)

```
In [18]: (my_workspace, solve1, print1, solve2, print2) = create_multi_solve_
↳workspace()
```

2. Submit to the server:

```
In [19]: my_workspace.submit()
NOTE: Added action set 'optimization'.
NOTE: There were 5 rows read from table 'MYDATA' in caslib 'CASUSER(casuser)'.
NOTE: Problem generation will use 8 threads.
NOTE: The problem has 5 variables (0 free, 0 fixed).
NOTE: The problem has 0 binary and 5 integer variables.
NOTE: The problem has 6 linear constraints (5 LE, 0 EQ, 1 GE, 0 range).
NOTE: The problem has 10 linear constraint coefficients.
NOTE: The problem has 0 nonlinear constraints (0 LE, 0 EQ, 0 GE, 0 range).
NOTE: The OPTMODEL presolver is disabled for linear problems.
NOTE: The initial MILP heuristics are applied.
NOTE: The MILP presolver value AUTOMATIC is applied.
NOTE: The MILP presolver removed 0 variables and 5 constraints.
NOTE: The MILP presolver removed 5 constraint coefficients.
NOTE: The MILP presolver modified 0 constraint coefficients.
NOTE: The resolved problem has 5 variables, 1 constraints, and 5 constraint_
↳coefficients.
NOTE: The MILP solver is called.
NOTE: The parallel Branch and Cut algorithm is used.
NOTE: The Branch and Cut algorithm is using up to 8 threads.
      Node   Active   Sols   BestInteger   BestBound   Gap   Time

3.7 Handling Data

sasoptpy can work with native Python types and pandas objects for all data operations. Among pandas object types, sasoptpy works with `pandas.DataFrame` and `pandas.Series` objects to construct and manipulate model components.

3.7.1 Indices

Methods like `Model.add_variables()` can use native Python object types such as list and range as variable and constraint indices. You can also use `pandas.Index` objects as indices as well.

List

```

In [1]: m = so.Model(name='demo')
NOTE: Initialized model demo.

In [2]: SEASONS = ['Fall', 'Winter', 'Spring', 'Summer']

In [3]: prod_lb = {'Fall': 100, 'Winter': 200, 'Spring': 100, 'Summer': 400}

In [4]: production = m.add_variables(SEASONS, lb=prod_lb, name='production')

In [5]: print(production)
Variable Group (production) [
  [Fall: production[Fall]]
  [Winter: production[Winter]]
  [Spring: production[Spring]]
  [Summer: production[Summer]]
]

```

```
In [6]: print(repr(production['Summer']))
sasoptpy.Variable(name='production[Summer]', lb=400, vartype='CONT')
```

If a list is used as the index set, associated fields such as *lb*, and *ub* should be accessible by using the index keys. Accepted types are dict and `pandas.Series`.

Range

```
In [7]: link = m.add_variables(range(3), range(2), vartype=so.BIN, name='link')
```

```
In [8]: print(link)
Variable Group (link) [
  [(0, 0): link[0, 0]]
  [(0, 1): link[0, 1]]
  [(1, 0): link[1, 0]]
  [(1, 1): link[1, 1]]
  [(2, 0): link[2, 0]]
  [(2, 1): link[2, 1]]
]
```

```
In [9]: print(repr(link[2, 1]))
sasoptpy.Variable(name='link[2,1]', lb=0, ub=1, vartype='BIN')
```

pandas.Index

```
In [10]: import pandas as pd
```

```
In [11]: p_data = [[3, 5, 9],
.....:             [0, -1, 14],
.....:             [5, 6, 20]]
.....:
```

```
In [12]: df = pd.DataFrame(p_data, columns=['c1', 'col_lb', 'col_ub'])
```

```
In [13]: x = m.add_variables(df.index, lb=df['c1'], vartype=so.INT, name='x')
```

```
In [14]: print(x)
Variable Group (x) [
  [0: x[0]]
  [1: x[1]]
  [2: x[2]]
]
```

```
In [15]: df2 = df.set_index(['r1', 'r2', 'r3'])
```

```
In [16]: y = m.add_variables(df2.index, lb=df2['col_lb'], ub=df2['col_ub'], name='y')
```

```
In [17]: print(y)
Variable Group (y) [
  [r1: y[r1]]
  [r2: y[r2]]
  [r3: y[r3]]
]
```

```
In [18]: print(repr(y['r1']))
sasoptpy.Variable(name='y[r1]', lb=5, ub=9, vartype='CONT')
```

Set

sasoptpy can work with data on the server and generate abstract expressions. For this purpose, you can use `Set` objects to represent PROC OPTMODEL sets.

```
In [19]: m2 = so.Model(name='m2')
NOTE: Initialized model m2.

In [20]: I = m2.add_set(name='I')

In [21]: u = m2.add_variables(I, name='u')

In [22]: print(I, u)
I Variable Group (u) [
]
```

See [Workflows](#) for more information about working with server-side models.

3.7.2 Data

sasoptpy can work with both client-side and server-side data. Here are some options to load data into the optimization models.

pandas DataFrame

`pandas.DataFrame` is the preferred object type for passing data into sasoptpy models.

```
In [23]: data = [
.....:     ['clock', 8, 4, 3],
.....:     ['mug', 10, 6, 5],
.....:     ['headphone', 15, 7, 2],
.....:     ['book', 20, 12, 10],
.....:     ['pen', 1, 1, 15]
.....: ]

In [24]: df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit']).set_
↳ index(['item'])

In [25]: get = so.VariableGroup(df.index, ub=df['limit'], name='get')

In [26]: print(get)
Variable Group (get) [
  [clock: get[clock]]
  [mug: get[mug]]
  [headphone: get[headphone]]
  [book: get[book]]
  [pen: get[pen]]
]
```

Dictionaries

You can use lists and dictionaries in expressions and when you create variables.

```
In [27]: items = ['clock', 'mug', 'headphone', 'book', 'pen']

In [28]: limits = {'clock': 3, 'mug': 5, 'headphone': 2, 'book': 10, 'pen': 15}

In [29]: get2 = so.VariableGroup(items, ub=limits, name='get2')

In [30]: print(get2)
Variable Group (get2) [
  [clock: get2[clock]]
  [mug: get2[mug]]
  [headphone: get2[headphone]]
  [book: get2[book]]
  [pen: get2[pen]]
]
```

CASTable

When data are available on the server-side, you can pass a reference to the object. Using `swat.cas.table.CASTable` and abstract data requires SAS Viya 3.4 or later.

```
In [31]: m2 = so.Model(name='m2', session=session)
NOTE: Initialized model m2.
```

```
In [32]: table = session.upload_frame(df)
NOTE: Cloud Analytic Services made the uploaded file available as table TMPS_SB39K7_
↳in caslib CASUSER(casuser).
NOTE: The table TMPS_SB39K7 has been created in caslib CASUSER(casuser) from binary_
↳data uploaded to Cloud Analytic Services.
```

```
In [33]: print(type(table), table)
<class 'swat.cas.table.CASTable'> CASTable('TMPS_SB39K7', caslib='CASUSER(casuser)')
```

```
In [34]: df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit'])

In [35]: ITEMS = m.add_set(name='ITEMS')

In [36]: value = m.add_parameter(ITEMS, name='value')

In [37]: weight = m.add_parameter(ITEMS, name='weight')

In [38]: limit = m.add_parameter(ITEMS, name='limit')

In [39]: from sasoptpy.actions import read_data

In [40]: m.include(read_data(table=table, index={'target': ITEMS, 'key': None},
.....:                               columns=[value, weight, limit]))
.....:

In [41]: get3 = m2.add_variables(ITEMS, name='get3')

In [42]: print(get3)
```

(continues on next page)

(continued from previous page)

```
Variable Group (get3) [
]
```

Abstract Data

If you would like to model your problem first and load data later, you can pass a string for the data that will be available later.

```
In [43]: from sasoptpy.actions import read_data

In [44]: m3 = so.Model(name='m3', session=session)
NOTE: Initialized model m3.

In [45]: ITEMS = m.add_set(name='ITEMS')

In [46]: limit = m.add_parameter(ITEMS, name='limit')

In [47]: m3.include(read_data(table='DF', index=['item'], columns=[limit]))

In [48]: print(type(ITEMS), ITEMS)
<class 'sasoptpy.abstract.set.Set'> ITEMS
```

Note that the key set is created as a reference. You can solve the problem later after having the data available with the same name (for example, by using the `swat.cas.connection.CAS.upload_frame()` function)

```
In [49]: session.upload_frame(df, casout='DF')
NOTE: Cloud Analytic Services made the uploaded file available as table DF in caslib_
↳CASUSER(casuser).
NOTE: The table DF has been created in caslib CASUSER(casuser) from binary data_
↳uploaded to Cloud Analytic Services.
Out[49]: CASTable('DF', caslib='CASUSER(casuser)')
```

3.7.3 Operations

You can use lists, `pandas.Series`, and `pandas.DataFrame` objects for mathematical operations such as `VariableGroup.mult()`.

```
In [50]: sd = [3, 5, 6]

In [51]: z = m.add_variables(3, name='z')
```

```
In [52]: print(z)
Variable Group (z) [
  [0: z[0]]
  [1: z[1]]
  [2: z[2]]
]
```

```
In [53]: print(repr(z))
sasoptpy.VariableGroup([0, 1, 2], name='z')
```

```
In [54]: e1 = z.mult(sd)

In [55]: print(e1)
3 * z[0] + 5 * z[1] + 6 * z[2]
```

```
In [56]: ps = pd.Series(sd)

In [57]: e2 = z.mult(ps)

In [58]: print(e2)
3 * z[0] + 5 * z[1] + 6 * z[2]
```

3.8 Workflows

sasoptpy can work with both client-side data and server-side data. Some limitations to the functionalities might apply in terms of which workflow is used. In this section, the overall flow of the package is explained.

3.8.1 Client-side models

If the data are client-side (Python), then a concrete model is generated on the client and is uploaded by using one of the available CAS actions.

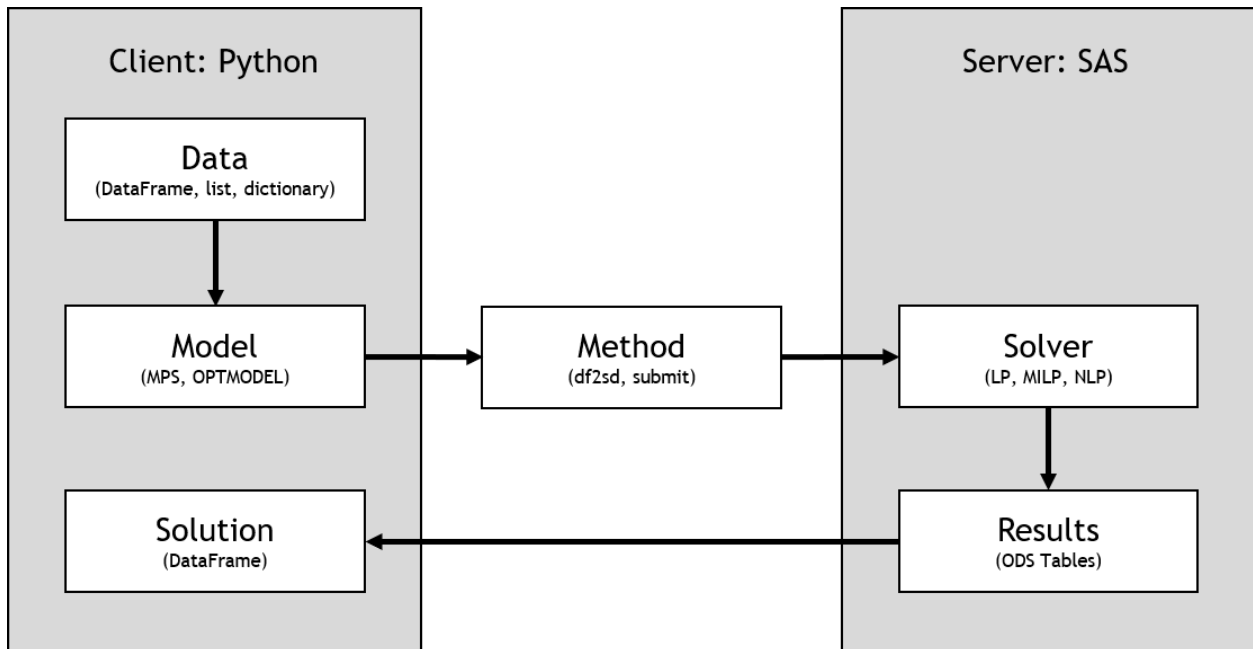

Using a client-side model brings several advantages, such as directly accessing variables, expressions, and constraints. You can more easily perform computationally intensive operations such as filtering data, sorting values, changing variable values, and printing expressions.

There are two main disadvantages of working with client-side models. First, if your model is relatively large, the generated MPS DataFrame or OPTMODEL code might allocate a large amount of memory on your machine. Second, the information that needs to be passed from client to server might be larger than it would be if you use a server-side model.

See the following representation of the client-side model workflow for CAS (Viya) servers:

See the following representation of the client-side model workflow for SAS clients:

Steps of modeling a simple knapsack problem are shown in the following subsections.

1. Reading data:

```

In [1]: import sasoptpy as so

In [2]: import pandas as pd

In [3]: from swat import CAS

In [4]: session = CAS(hostname, port)
  
```

(continues on next page)

(continued from previous page)

```

In [5]: m = so.Model(name='client_CAS', session=session)
NOTE: Initialized model client_CAS.

In [6]: data = [
...:     ['clock', 8, 4, 3],
...:     ['mug', 10, 6, 5],
...:     ['headphone', 15, 7, 2],
...:     ['book', 20, 12, 10],
...:     ['pen', 1, 1, 15]
...: ]

In [7]: df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit'])

In [8]: ITEMS = df.index

In [9]: value = df['value']

In [10]: weight = df['weight']

In [11]: limit = df['limit']

In [12]: total_weight = 55

In [13]: print(type(ITEMS), ITEMS)
<class 'pandas.core.indexes.range.RangeIndex'> RangeIndex(start=0, stop=5, step=1)

In [14]: print(type(total_weight), total_weight)
<class 'int'> 55

```

Here, you can obtain the column values one by one:

```

>>> df = df.set_index('item')
>>> ITEMS = df.index.tolist()
>>> value = df['value']
>>> weight = df['weight']
>>> limit = df['limit']

```

2. Creating the optimization model:

```

# Variables
In [15]: get = m.add_variables(ITEMS, name='get', vartype=so.INT, lb=0)

# Constraints
In [16]: m.add_constraints((get[i] <= limit[i] for i in ITEMS), name='limit_con');

In [17]: m.add_constraint(
...:     so.expr_sum(weight[i] * get[i] for i in ITEMS) <= total_weight,
...:     name='weight_con');
...:

# Objective
In [18]: total_value = so.expr_sum(value[i] * get[i] for i in ITEMS)

In [19]: m.set_objective(total_value, name='total_value', sense=so.MAX);

```

(continues on next page)

(continued from previous page)

```
# Solve
In [20]: m.solve(verbose=True)
NOTE: Added action set 'optimization'.
NOTE: Converting model client_CAS to OPTMODEL.
    var get {{0,1,2,3,4}} integer >= 0;
    con limit_con_0 : get[0] <= 3;
    con limit_con_1 : get[1] <= 5;
    con limit_con_2 : get[2] <= 2;
    con limit_con_3 : get[3] <= 10;
    con limit_con_4 : get[4] <= 15;
    con weight_con : 4 * get[0] + 6 * get[1] + 7 * get[2] + 12 * get[3] + get[4]
    <= 55;
    max total_value = 8 * get[0] + 10 * get[1] + 15 * get[2] + 20 * get[3] +
    get[4];
    solve;
    create data solution from [i]= {1.._NVAR_} var=_VAR_.name value=_VAR_ lb=_VAR_.
    lb ub=_VAR_.ub rc=_VAR_.rc;
    create data dual from [j] = {1.._NCON_} con=_CON_.name value=_CON_.body dual=_
    CON_.dual;

NOTE: Submitting OPTMODEL code to CAS server.
NOTE: Problem generation will use 8 threads.
NOTE: The problem has 5 variables (0 free, 0 fixed).
NOTE: The problem has 0 binary and 5 integer variables.
NOTE: The problem has 6 linear constraints (6 LE, 0 EQ, 0 GE, 0 range).
NOTE: The problem has 10 linear constraint coefficients.

    and 4 columns.
NOTE: The CAS table 'problemSummary' in caslib 'CASUSER(casuser)' has 20 rows and
    4 columns.
Out [20]:
Selected Rows from Table SOLUTION
```

(continues on next page)

(continued from previous page)

	i	var	value	lb	ub	rc
0	1.0	get[0]	2.0	-0.0	1.797693e+308	NaN
1	2.0	get[1]	5.0	-0.0	1.797693e+308	NaN
2	3.0	get[2]	2.0	-0.0	1.797693e+308	NaN
3	4.0	get[3]	-0.0	-0.0	1.797693e+308	NaN
4	5.0	get[4]	3.0	-0.0	1.797693e+308	NaN

You can display the generated OPTMODEL code at run time by using the `verbose=True` option. Here, you can see the coefficient values of the parameters inside the model.

3. Parsing the results:

After the solve, the primal and dual solution tables are obtained. You can print the solution tables by using the `Model.get_solution()` method.

It is also possible to print the optimal solution by using the `get_solution_table()` function.

```
In [21]: print(m.get_solution())
Selected Rows from Table SOLUTION
```

	i	var	value	lb	ub	rc
0	1.0	get[0]	2.0	-0.0	1.797693e+308	NaN
1	2.0	get[1]	5.0	-0.0	1.797693e+308	NaN
2	3.0	get[2]	2.0	-0.0	1.797693e+308	NaN
3	4.0	get[3]	-0.0	-0.0	1.797693e+308	NaN
4	5.0	get[4]	3.0	-0.0	1.797693e+308	NaN

```
In [22]: print(so.get_solution_table(get, key=ITEMS))
get
0 2.0
1 5.0
2 2.0
3 -0.0
4 3.0
```

```
In [23]: print('Total value:', total_value.get_value())
Total value: 99.0
```

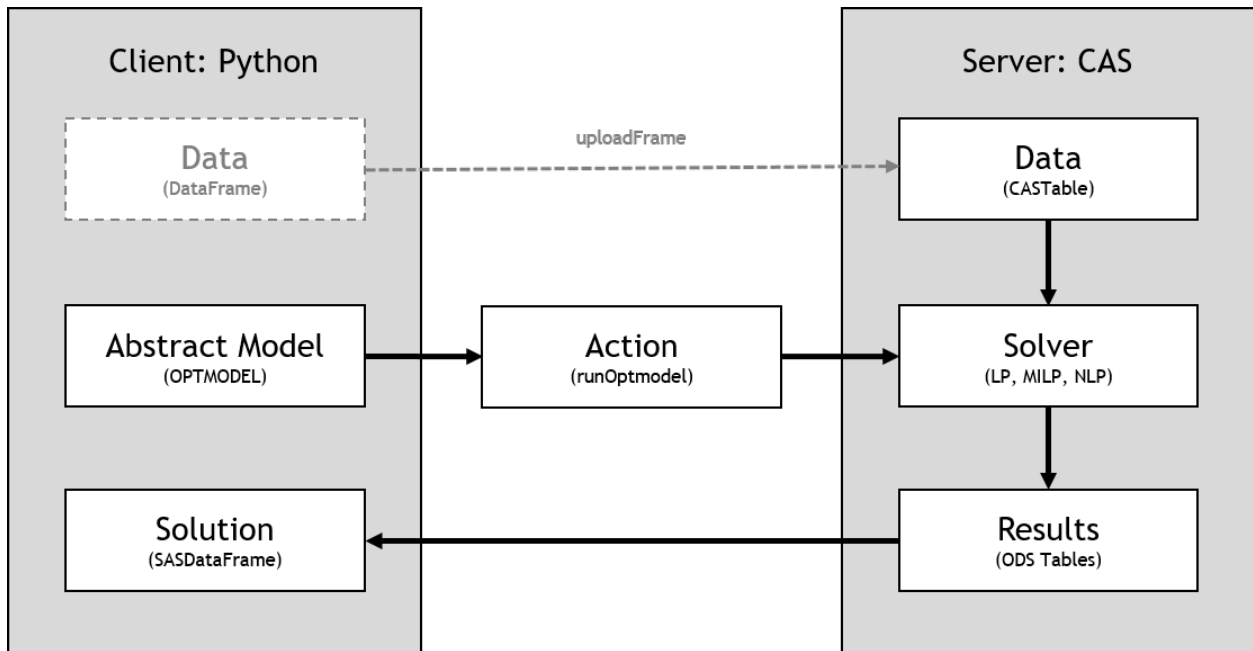

3.8.2 Server-side models

If the data are server-side (CAS or SAS), then an abstract model is generated on the client. This abstract model is later converted to PROC OPTMODEL code, which reads the data on the server.

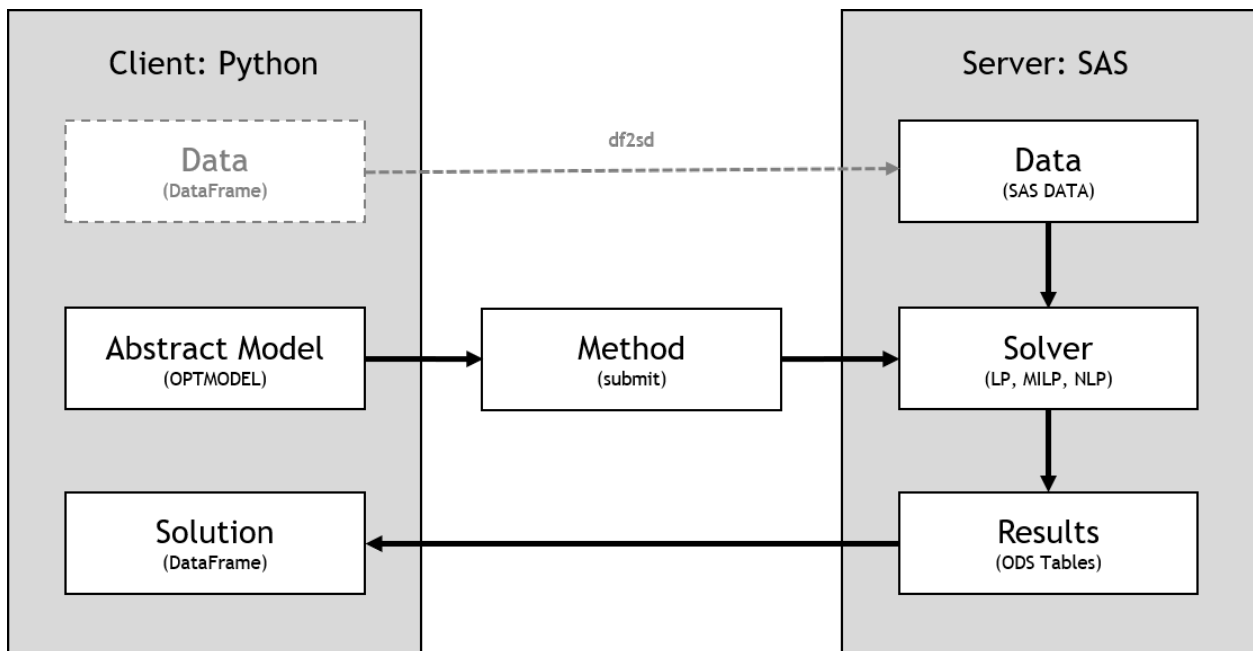

The main advantage of the server-side models is faster upload times compared to client-side models. This is especially noticeable when using large numbers of variable and constraint groups.

The only disadvantage of using server-side models is that variables often need to be accessed directly from the resulting SAS DataFrame objects. Because components of the models are abstract, accessing objects directly is often not possible.

See the following representation of the server-side model workflow for CAS (Viya) servers:

See the following representation of the server-side model workflow for SAS clients:

In the following steps, the same example is solved by using server-side data.

1. Creating the optimization model:

```
In [24]: from sasoptpy.actions import read_data
```

```
In [25]: m = so.Model(name='client_CAS', session=session)
NOTE: Initialized model client_CAS.
```

```
In [26]: cas_table = session.upload_frame(df, casout='data')
```

NOTE: Cloud Analytic Services made the uploaded file available as table DATA in `caslib CASUSER(casuser)`. (continues on next page)

(continued from previous page)

NOTE: The table DATA has been created in caslib CASUSER(casuser) from binary data_
 ↳uploaded to Cloud Analytic Services.

```
In [27]: ITEMS = m.add_set(name='ITEMS', settype=so.STR)

In [28]: value = m.add_parameter(ITEMS, name='value')

In [29]: weight = m.add_parameter(ITEMS, name='weight')

In [30]: limit = m.add_parameter(ITEMS, name='limit')

In [31]: m.include(read_data(
.....:     table=cas_table, index={'target':ITEMS, 'key': 'item'},
.....:     columns=[value, weight, limit]))
.....:

# Variables
In [32]: get = m.add_variables(ITEMS, name='get', vartype=so.INT, lb=0)

# Constraints
In [33]: m.add_constraints((get[i] <= limit[i] for i in ITEMS), name='limit_con');

In [34]: m.add_constraint(
.....:     so.expr_sum(weight[i] * get[i] for i in ITEMS) <= total_weight,
.....:     name='weight_con');
.....:

# Objective
In [35]: total_value = so.expr_sum(value[i] * get[i] for i in ITEMS)

In [36]: m.set_objective(total_value, name='total_value', sense=so.MAX);

# Solve
In [37]: m.solve(verbose=True)
NOTE: Added action set 'optimization'.
NOTE: Converting model client_CAS to OPTMODEL.
    set <str> ITEMS;
    num value {{ITEMS}};
    num weight {{ITEMS}};
    num limit {{ITEMS}};
    read data DATA into ITEMS=[item] value weight limit;

Out [37]:
Selected Rows from Table SOLUTION

```

	i	var	value	lb	ub	rc
0	1.0	get[book]	2.0	-0.0	1.797693e+308	NaN
1	2.0	get[clock]	3.0	-0.0	1.797693e+308	NaN
2	3.0	get[headphone]	2.0	-0.0	1.797693e+308	NaN
3	4.0	get[mug]	-0.0	-0.0	1.797693e+308	NaN
4	5.0	get[pen]	5.0	-0.0	1.797693e+308	NaN

2. Parsing the results:

```

# Print results
In [38]: print(m.get_solution())
Selected Rows from Table SOLUTION

```

	i	var	value	lb	ub	rc
0	1.0	get[book]	2.0	-0.0	1.797693e+308	NaN
1	2.0	get[clock]	3.0	-0.0	1.797693e+308	NaN
2	3.0	get[headphone]	2.0	-0.0	1.797693e+308	NaN
3	4.0	get[mug]	-0.0	-0.0	1.797693e+308	NaN
4	5.0	get[pen]	5.0	-0.0	1.797693e+308	NaN

```

In [39]: print('Total value:', m.get_objective_value())
Total value: 99.0

```

Because there is no direct access to expressions and variables, the optimal solution is printed by using the server response.

3.8.3 Limitations

- In SAS Viya, nonlinear models can be solved only by using the `runOptmodel` action, which requires SAS Viya 3.4 or later.
- User-defined decomposition blocks are available only in MPS mode, and therefore work only with client-side data.
- Mixed usage (client-side and server-side data) might not work in some cases. A quick fix would be transferring the data in either direction.

EXAMPLES

Examples are provided from [SAS/OR documentation](#).

This chapter is split into 3 parts.

- The *first part* of examples demonstrate using SAS Viya (SAS Optimization) solvers with concrete problem formulation.
- The *second part* of examples demonstrate using SAS Viya (SAS Optimization) solvers with abstract problem formulation.
- The *third part* of examples demonstrate using SAS 9.4 (SAS/OR) solvers.

4.1 SAS Viya Examples (Concrete)

4.1.1 Food Manufacture 1

API REFERENCE

5.1 Core

5.1.1 Model

Constructor

<code>Model(**kwargs)</code>	Creates an optimization model
------------------------------	-------------------------------

`sasoptpy.Model`

class `Model` (***kwargs*)

Bases: `object`

Creates an optimization model

Parameters

name [string] Name of the model

session [`swat.cas.connection.CAS` or `saspy.SASsession`, optional] CAS or SAS Session object

Examples

```
>>> from swat import CAS
>>> import sasoptpy as so
>>> s = CAS('cas.server.address', port=12345)
>>> m = so.Model(name='my_model', session=s)
NOTE: Initialized model my_model
```

```
>>> mip = so.Model(name='mip')
NOTE: Initialized model mip
```

Components

<code>Model.get_name(self)</code>	Returns model name
<code>Model.set_session(self, session)</code>	Sets the session of model
<code>Model.get_session(self)</code>	Returns the session of the model
<code>Model.get_session_type(self)</code>	Tests whether the model session is defined and still active
<code>Model.set_objective(self, expression, name)</code>	Specifies the objective function for the model
<code>Model.append_objective(self, expression, name)</code>	Appends a new objective to the model
<code>Model.get_objective(self)</code>	Returns the objective function as an <i>Expression</i> object
<code>Model.get_all_objectives(self)</code>	Returns a list of objectives in the model
<code>Model.add_variable(self, name[, vartype, ...])</code>	Adds a new variable to the model
<code>Model.add_variables(self, *argv[, name, ...])</code>	Adds a group of variables to the model
<code>Model.add_implicit_variable(self[, argv, name])</code>	Adds an implicit variable to the model
<code>Model.get_variable(self, name)</code>	Returns the reference to a variable in the model
<code>Model.get_variables(self)</code>	Returns a list of variables
<code>Model.get_grouped_variables(self)</code>	Returns an ordered dictionary of variables
<code>Model.get_implicit_variables(self)</code>	Returns a list of implicit variables
<code>Model.get_variable_coef(self, var)</code>	Returns the objective value coefficient of a variable
<code>Model.drop_variable(self, variable)</code>	Drops a variable from the model
<code>Model.drop_variables(self, variables)</code>	Drops a variable group from the model
<code>Model.add_constraint(self, c, name)</code>	Adds a single constraint to the model
<code>Model.add_constraints(self, argv[, name])</code>	Adds a set of constraints to the model
<code>Model.get_constraint(self, name)</code>	Returns the reference to a constraint in the model
<code>Model.get_constraints(self)</code>	Returns a list of constraints in the model
<code>Model.get_grouped_constraints(self)</code>	Returns an ordered dictionary of constraints
<code>Model.drop_constraint(self, constraint)</code>	Drops a constraint from the model
<code>Model.drop_constraints(self, constraints)</code>	Drops a constraint group from the model
<code>Model.add_set(self, name[, init, value, settype])</code>	Adds a set to the model
<code>Model.add_parameter(self, *argv[, name, ...])</code>	Adds a <i>abstract.Parameter</i> object to the model
<code>Model.add_statement(self, statement[, ...])</code>	Adds a PROC OPTMODEL statement to the model
<code>Model.get_sets(self)</code>	Returns a list of Set objects in the model
<code>Model.get_parameters(self)</code>	Returns a list of <i>abstract.Parameter</i> and <i>abstract.ParameterGroup</i> objects in the model
<code>Model.get_statements(self)</code>	Returns a list of all statements inside the model
<code>Model.include(self, *argv)</code>	Adds existing variables and constraints to a model

sasoptpy.Model.get_name

`Model.get_name(self)`
Returns model name

sasoptpy.Model.set_session

`Model.set_session(self, session)`
Sets the session of model

Parameters

session [`swat.cas.connection.CAS` or `saspy.SASsession`] CAS or SAS Session object

Notes

- You can use CAS sessions (via SWAT package) or SAS sessions (via SASPy package)
- Session of a model can be set at initialization. See [Model](#).

sasoptpy.Model.get_session

`Model.get_session(self)`
Returns the session of the model

Returns

session [`swat.cas.connection.CAS` or `saspy.SASsession`] Session of the model, or None

sasoptpy.Model.get_session_type

`Model.get_session_type(self)`
Tests whether the model session is defined and still active

Returns

session [string] 'CAS' for CAS sessions, 'SAS' for SAS sessions

sasoptpy.Model.set_objective

`Model.set_objective(self, expression, name, sense=None)`
Specifies the objective function for the model

Parameters

expression [[Expression](#)] The objective function as an Expression

name [string] Name of the objective value

sense [string, optional] Objective value direction, `sasoptpy.MIN` or `sasoptpy.MAX`

Returns

objective [*Expression*] Objective function as an *Expression* object

See also:

Model.append_objective()

Notes

- Default objective sense is minimization *MIN*.
- This method replaces the existing objective of the model. When working with multiple objectives, use the *Model.append_objective()* method.

Examples

```
>>> profit = so.Expression(5 * sales - 2 * material, name='profit')
>>> m.set_objective(profit, so.MAX)
>>> print(m.get_objective())
- 2.0 * material + 5.0 * sales
```

```
>>> m.set_objective(4 * x - 5 * y, name='obj')
>>> print(repr(m.get_objective()))
sasoptpy.Expression(exp = 4.0 * x - 5.0 * y , name='obj')
```

```
>>> f1 = m.set_objective(2 * x + y, sense=so.MIN, name='f1')
>>> f2 = m.append_objective( (x - y) ** 2, sense=so.MIN, name='f2')
>>> print(m.to_optmodel(options={'with': 'blackbox', 'obj': (f1, f2)}))
proc optmodel;
var x;
var y;
min f1 = 2 * x + y;
min f2 = (x - y) ^ (2);
solve with blackbox obj (f1 f2);
print _var_.name _var_.lb _var_.ub _var_ _var_.rc;
print _con_.name _con_.body _con_.dual;
quit;
```

sasoptpy.Model.append_objective

Model.append_objective (*self*, *expression*, *name*, *sense=None*)

Appends a new objective to the model

Parameters

expression [*Expression*] The objective function as an *Expression*

name [string] Name of the objective value

sense [string, optional] Objective value direction, *sasoptpy.MIN* or *sasoptpy.MAX*

Returns

objective [*Expression*] Objective function as an *Expression* object

See also:

Model.set_objective()

Notes

- Default objective sense is minimization *MIN*.

Examples

```
>>> f1 = m.set_objective(2 * x + y, sense=so.MIN, name='f1')
>>> f2 = m.append_objective( (x - y) ** 2, sense=so.MIN, name='f2')
>>> print(m.to_optmodel(options={'with': 'blackbox', 'obj': (f1, f2)}))
proc optmodel;
var x;
var y;
min f1 = 2 * x + y;
min f2 = (x - y) ^ (2);
solve with blackbox obj (f1 f2);
print _var_.name _var_.lb _var_.ub _var_ _var_.rc;
print _con_.name _con_.body _con_.dual;
quit;
```

sasoptpy.Model.get_objective

`Model.get_objective(self)`

Returns the objective function as an *Expression* object

Returns

objective [*Expression*] Objective function

Examples

```
>>> m.set_objective(4 * x - 5 * y, name='obj')
>>> print(repr(m.get_objective()))
sasoptpy.Expression(exp = 4.0 * x - 5.0 * y, name='obj')
```

sasoptpy.Model.get_all_objectives

`Model.get_all_objectives(self)`

Returns a list of objectives in the model

Returns

all_objectives [list] A list of *Objective* objects

Examples

```
>>> m = so.Model(name='test_set_get_objective')
>>> x = m.add_variable(name='x')
>>> obj1 = m.set_objective(2 * x, sense=so.MIN, name='obj1')
>>> obj2 = m.set_objective(5 * x, sense=so.MIN, name='obj2') # Overrides obj1
>>> obj3 = m.append_objective(10 * x, sense=so.MIN, name='obj3')
>>> assertEquals(m.get_all_objectives(), [obj2, obj3])
True
```

sasoptpy.Model.add_variable

`Model.add_variable(self, name, vartype=None, lb=None, ub=None, init=None)`

Adds a new variable to the model

New variables can be created via this method or existing variables can be added to the model.

Parameters

name [string] Name of the variable to be created

vartype [string, optional] Type of the variable, either *sasoptpy.BIN*, *sasoptpy.INT* or *sasoptpy.CONT*

lb [float, optional] Lower bound of the variable

ub [float, optional] Upper bound of the variable

init [float, optional] Initial value of the variable

Returns

var [*Variable*] Variable that is added to the model

See also:

Variable, *Model.include()*

Notes

- *name* is a mandatory field for this method.

Examples

Adding a variable on the fly

```
>>> m = so.Model(name='demo')
>>> x = m.add_variable(name='x', vartype=so.INT, ub=10, init=2)
>>> print(repr(x))
NOTE: Initialized model demo
sasoptpy.Variable(name='x', lb=0, ub=10, init=2, vartype='INT')
```

Adding an existing variable to a model

```
>>> y = so.Variable(name='y', vartype=so.BIN)
>>> m = so.Model(name='demo')
>>> m.include(y)
```

sasoptpy.Model.add_variables

`Model.add_variables` (*self*, **argv*, *name=None*, *vartype=None*, *lb=None*, *ub=None*, *init=None*)

Adds a group of variables to the model

Parameters

argv [list, dict, `pandas.Index`] Loop index for variable group

name [string, optional] Name of the variables

vartype [string, optional] Type of variables, *BIN*, *INT*, or *CONT*

lb [list, dict, `pandas.Series`] Lower bounds of variables

ub [list, dict, `pandas.Series`] Upper bounds of variables

init [list, dict, `pandas.Series`] Initial values of variables

See also:

VariableGroup, *Model.include()*

Examples

```
>>> production = m.add_variables(PERIODS, vartype=so.INT,
                                name='production', lb=min_production)
>>> print(production)
>>> print(repr(production))
Variable Group (production) [
  [Period1: production['Period1',]]
  [Period2: production['Period2',]]
  [Period3: production['Period3',]]
]
sasoptpy.VariableGroup(['Period1', 'Period2', 'Period3'],
name='production')
```

sasoptpy.Model.add_implicit_variable

`Model.add_implicit_variable` (*self*, *argv=None*, *name=None*)

Adds an implicit variable to the model

Parameters

argv [Generator-type object] Generator object where each item is an entry

name [string, optional] Name of the implicit variable

Notes

- Based on whether the implicit variables are generated by a regular or abstract expression, they can appear in generated OPTMODEL codes.

Examples

```
>>> x = m.add_variables(range(5), name='x')
>>> y = m.add_implicit_variable((
>>>     x[i] + 2 * x[i+1] for i in range(4)), name='y')
>>> print(y[2])
x[2] + 2 * x[3]
```

```
>>> I = m.add_set(name='I')
>>> z = m.add_implicit_variable((x[i] * 2 + 2 for i in I), name='z')
>>> print(z._defn())
impvar z {i_1 in I} = 2 * x[i_1] + 2;
```

sasoptpy.Model.get_variable

`Model.get_variable(self, name)`

Returns the reference to a variable in the model

Parameters

name [string] Name or key of the variable requested

Returns

variable [*Variable*] Reference to the variable

Examples

```
>>> m.add_variable(name='x', vartype=so.INT, lb=3, ub=5)
>>> var1 = m.get_variable('x')
>>> print(repr(var1))
sasoptpy.Variable(name='x', lb=3, ub=5, vartype='INT')
```

sasoptpy.Model.get_variables

`Model.get_variables(self)`

Returns a list of variables

Returns

variables [list] List of variables in the model

Examples

```
>>> x = m.add_variables(2, name='x')
>>> y = m.add_variable(name='y')
>>> print(m.get_variables())
[sasoptpy.Variable(name='x_0', vartype='CONT'),
 sasoptpy.Variable(name='x_1', vartype='CONT'),
 sasoptpy.Variable(name='y', vartype='CONT')]
```

sasoptpy.Model.get_grouped_variables

`Model.get_grouped_variables(self)`
Returns an ordered dictionary of variables

Returns

grouped_vars [OrderedDict] Dictionary of variables and variable groups in the model

See also:

[`Model.get_variables\(\)`](#), [`Model.get_grouped_constraints\(\)`](#)

Examples

```
>>> m1 = so.Model(name='test_copy_model_1')
>>> x = m1.add_variable(name='x')
>>> y = m1.add_variables(2, name='y')
>>> vars = OrderedDict([('x', x), ('y', y)])
>>> self.assertEqual(m1.get_grouped_variables(), vars)
True
```

sasoptpy.Model.get_implicit_variables

`Model.get_implicit_variables(self)`
Returns a list of implicit variables

Returns

implicit_variables [list] List of implicit variables in the model

Examples

```
>>> m = so.Model(name='test_add_impvar')
>>> x = m.add_variables(5, name='x')
>>> y = m.add_implicit_variable((i * x[i] + x[i] ** 2 for i in range(5)),
                                name='y')
>>> assertEquals([y], m.get_implicit_variables())
True
```

`sasoptpy.Model.get_variable_coef`

`Model.get_variable_coef(self, var)`

Returns the objective value coefficient of a variable

Parameters

var [*Variable* or string] Variable whose objective value is requested. It can be either the variable object itself, or the name of the variable.

Returns

coef [float] Objective value coefficient of the given variable

Examples

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> m.set_objective(4 * x - 5 * y, name='obj', sense=so.MAX)
>>> print(m.get_variable_coef(x))
4.0
>>> print(m.get_variable_coef('y'))
-5.0
```

`sasoptpy.Model.drop_variable`

`Model.drop_variable(self, variable)`

Drops a variable from the model

Parameters

variable [*Variable*] The variable to be dropped from the model

See also:

`Model.drop_variables()`

`Model.drop_constraint()`

`Model.drop_constraints()`

Examples

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> print(m.get_variable('x'))
x
>>> m.drop_variable(x)
>>> print(m.get_variable('x'))
None
```

sasoptpy.Model.drop_variables

`Model.drop_variables(self, variables)`

Drops a variable group from the model

Parameters

variables [*VariableGroup*] The variable group to be dropped from the model

See also:

`Model.drop_variable()`

`Model.drop_constraint()`

`Model.drop_constraints()`

Examples

```

>>> x = m.add_variables(3, name='x')
>>> print(m.get_variables())
[sasoptpy.Variable(name='x_0', vartype='CONT'),
 sasoptpy.Variable(name='x_1', vartype='CONT')]
>>> m.drop_variables(x)
>>> print(m.get_variables())
[]

```

sasoptpy.Model.add_constraint

`Model.add_constraint(self, c, name)`

Adds a single constraint to the model

Parameters

c [*Constraint*] Constraint to be added to the model

name [string, optional] Name of the constraint

Returns

c [*Constraint*] Reference to the constraint

See also:

`Constraint`, `Model.include()`

Examples

```

>>> x = m.add_variable(name='x', vartype=so.INT, lb=0, ub=5)
>>> y = m.add_variables(3, name='y', vartype=so.CONT, lb=0, ub=10)
>>> c1 = m.add_constraint(x + y[0] >= 3, name='c1')
>>> print(c1)
x + y[0] >= 3

```

```
>>> c2 = m.add_constraint(x - y[2] == [4, 10], name='c2')
>>> print(c2)
- y[2] + x = [4, 10]
```

`sasoptpy.Model.add_constraints`

`Model.add_constraints` (*self*, *argv*, *name=None*)

Adds a set of constraints to the model

Parameters

argv [Generator-type object] List of constraints as a generator-type Python object

name [string, optional] Name for the constraint group and individual constraint prefix

Returns

cg [[ConstraintGroup](#)] Reference to the ConstraintGroup

See also:

[ConstraintGroup](#), [Model.include\(\)](#)

Examples

```
>>> x = m.add_variable(name='x', vartype=so.INT, lb=0, ub=5)
>>> y = m.add_variables(3, name='y', vartype=so.CONT, lb=0, ub=10)
>>> c = m.add_constraints((x + 2 * y[i] >= 2 for i in [0, 1, 2]),
                          name='c')
>>> print(c)
Constraint Group (c) [
  [0: 2.0 * y[0] + x >= 2]
  [1: 2.0 * y[1] + x >= 2]
  [2: 2.0 * y[2] + x >= 2]
]
```

```
>>> t = m.add_variables(3, 4, name='t')
>>> ct = m.add_constraints((t[i, j] <= x for i in range(3)
                           for j in range(4)), name='ct')
>>> print(ct)
Constraint Group (ct) [
  [(0, 0): - x + t[0, 0] <= 0]
  [(0, 1): t[0, 1] - x <= 0]
  [(0, 2): - x + t[0, 2] <= 0]
  [(0, 3): t[0, 3] - x <= 0]
  [(1, 0): t[1, 0] - x <= 0]
  [(1, 1): t[1, 1] - x <= 0]
  [(1, 2): - x + t[1, 2] <= 0]
  [(1, 3): - x + t[1, 3] <= 0]
  [(2, 0): - x + t[2, 0] <= 0]
  [(2, 1): t[2, 1] - x <= 0]
  [(2, 2): t[2, 2] - x <= 0]
  [(2, 3): t[2, 3] - x <= 0]
]
```

sasoptpy.Model.get_constraint

`Model.get_constraint(self, name)`

Returns the reference to a constraint in the model

Parameters

name [string] Name of the constraint requested

Returns

constraint [*Constraint*] Requested :class:`Constraint` object

Examples

```
>>> m.add_constraint(2 * x + y <= 15, name='c1')
>>> print(m.get_constraint('c1'))
2.0 * x + y <= 15
```

sasoptpy.Model.get_constraints

`Model.get_constraints(self)`

Returns a list of constraints in the model

Returns

constraints [list] A list of *Constraint* objects

Examples

```
>>> m.add_constraint(x[0] + y <= 15, name='c1')
>>> m.add_constraints((2 * x[i] - y >= 1 for i in [0, 1]), name='c2')
>>> print(m.get_constraints())
[sasoptpy.Constraint( x[0] + y <= 15, name='c1'),
 sasoptpy.Constraint( 2.0 * x[0] - y >= 1, name='c2_0'),
 sasoptpy.Constraint( 2.0 * x[1] - y >= 1, name='c2_1')]
```

sasoptpy.Model.get_grouped_constraints

`Model.get_grouped_constraints(self)`

Returns an ordered dictionary of constraints

Returns

grouped_cons [OrderedDict] Dictionary of constraints and constraint groups in the model

See also:

Model.get_constraints(), *Model.get_grouped_variables()*

Examples

```
>>> m1 = so.Model(name='test_copy_model_1')
>>> x = m1.add_variable(name='x')
>>> y = m1.add_variables(2, name='y')
>>> c1 = m1.add_constraint(x + y[0] >= 2, name='c1')
>>> c2 = m1.add_constraints((x - y[i] <= 10 for i in range(2)), name='c2')
>>> cons = OrderedDict([('c1', c1), ('c2', c2)])
>>> self.assertEqual(m1.get_grouped_constraints(), cons)
True
```

`sasoptpy.Model.drop_constraint`

`Model.drop_constraint` (*self*, *constraint*)

Drops a constraint from the model

Parameters

constraint [*Constraint*] The constraint to be dropped from the model

See also:

`Model.drop_constraints()`

`Model.drop_variable()`

`Model.drop_variables()`

Examples

```
>>> c1 = m.add_constraint(2 * x + y <= 15, name='c1')
>>> print(m.get_constraint('c1'))
2 * x + y <= 15
>>> m.drop_constraint(c1)
>>> print(m.get_constraint('c1'))
None
```

`sasoptpy.Model.drop_constraints`

`Model.drop_constraints` (*self*, *constraints*)

Drops a constraint group from the model

Parameters

constraints [*ConstraintGroup*] The constraint group to be dropped from the model

See also:

`Model.drop_constraints()`

`Model.drop_variable()`

`Model.drop_variables()`

Examples

```
>>> c1 = m.add_constraints((x[i] + y <= 15 for i in [0, 1]), name='c1')
>>> print(m.get_constraints())
[sasoptpy.Constraint( x[0] + y <= 15, name='c1_0'),
 sasoptpy.Constraint( x[1] + y <= 15, name='c1_1')]
>>> m.drop_constraints(c1)
>>> print(m.get_constraints())
[]
```

sasoptpy.Model.add_set

`Model.add_set(self, name, init=None, value=None, settype=None)`

Adds a set to the model

Parameters

name [string, optional] Name of the set

init [Set, optional] Initial value of the set

value [list, float, optional] Exact value of the set

settype [list, optional] Types of the set as a list

The list can have one more *num* (for float) and *str* (for string) values. You can use *sasoptpy.NUM* and *sasoptpy.STR* for floats and strings, respectively.

Examples

```
>>> I = m.add_set(name='I')
>>> print(I._defn())
set I;
```

```
>>> J = m.add_set(name='J', settype=['str'])
>>> print(J._defn())
set <str> J;
```

```
>>> N = m.add_parameter(name='N', init=4)
>>> K = m.add_set(name='K', init=so.exp_range(1, N))
>>> print(K._defn())
set K = 1..N;
```

```
>>> m.add_set(name='W', settype=[so.STR, so.NUM])
>>> print(W._defn())
set <str, num> W;
```

sasoptpy.Model.add_parameter

`Model.add_parameter` (*self*, **argv*, *name=None*, *init=None*, *value=None*, *p_type=None*)

Adds a *abstract.Parameter* object to the model

Parameters

- argv** [Set, optional] Index or indices of the parameter
- name** [string, optional] Name of the parameter
- init** [float or expression, optional] Initial value of the parameter
- p_type** [string, optional] Type of the parameter, ‘num’ for floats or ‘str’ for strings

Returns

- p** [*abstract.Parameter* or *abstract.ParameterGroup*] A single parameter or a parameter group

Examples

```
>>> I = m.add_set(name='I')
>>> a = m.add_parameter(I, name='a', init=5)
>>> print(a._defn())
num a {I} init 5 ;
```

```
>>> I = m.add_set(name='I')
>>> J = m.add_set(name='J')
>>> p = m.add_parameter(I, J, name='p')
>>> print(p._defn())
num p {{I,J}};
```

sasoptpy.Model.add_statement

`Model.add_statement` (*self*, *statement*, *after_solve=None*)

Adds a PROC OPTMODEL statement to the model

Parameters

- statement** [*Expression* or string] Statement object
- after_solve** [boolean] Switch for appending the statement after the problem solution

Notes

- If the statement string includes ‘print’, then the statement is automatically placed after the solve even if *after_solve* is *False*.

Examples

```
>>> I = m.add_set(name='I')
>>> x = m.add_variables(I, name='x', vartype=so.INT)
>>> a = m.add_parameter(I, name='a')
>>> c = m.add_constraints((x[i] <= 2 * a[i] for i in I), name='c')
>>> m.add_statement('print x;', after_solve=True)
>>> print(m.to_optmodel())
proc optmodel;
min m_obj = 0;
set I;
var x {I} integer >= 0;
num a {I};
con c {i_1 in I} : x[i_1] - 2.0 * a[i_1] <= 0;
solve;
print _var_.name _var_.lb _var_.ub _var_ _var_.rc;
print _con_.name _con_.body _con_.dual;
print x;
quit;
```

sasoptpy.Model.get_sets

`Model.get_sets(self)`

Returns a list of `Set` objects in the model

Returns

set_list [list] List of sets in the model

Examples

```
>>> m.get_sets()
[sasoptpy.abstract.Set(name=W, settype=['str', 'num']), sasoptpy.abstract.
↪Set(name=I, settype=['num']), sasoptpy.abstract.Set(name=J, settype=['num'])]
```

sasoptpy.Model.get_parameters

`Model.get_parameters(self)`

Returns a list of `abstract.Parameter` and `abstract.ParameterGroup` objects in the model

Returns

param_list [list] List of parameters in the model

Examples

```
>>> for i in m.get_parameters():
...     print(i.get_name(), type(i))
p <class 'sasoptpy.abstract.parameter_group.ParameterGroup'>
r <class 'sasoptpy.abstract.parameter.Parameter'>
```

sasoptpy.Model.get_statements

`Model.get_statements(self)`

Returns a list of all statements inside the model

Returns

st_list [list] List of all statement objects

Examples

```
>>> m.add_statement(so.abstract.LiteralStatement("expand;"))
>>> m.get_statements()
[<sasoptpy.abstract.statement.literal.LiteralStatement object at 0x7fe0202fc358>]
>>> print(m.to_optmodel())
proc optmodel;
var x;
min obj1 = x * x;
expand;
solve;
quit;
```

sasoptpy.Model.include

`Model.include(self, *argv)`

Adds existing variables and constraints to a model

Parameters

argv : Objects to be included in the model

Notes

- Valid object types for *argv* parameter:
 - Model*
Including a model causes all variables and constraints inside the original model to be included.
 - Variable*
 - Constraint*
 - VariableGroup*
 - ConstraintGroup*
 - Objective*

- Set
- Parameter
- ParameterGroup
- Statement and all subclasses
- ImplicitVar

Examples

Adding an existing variable

```
>>> x = so.Variable(name='x', vartype=so.CONT)
>>> m.include(x)
```

Adding an existing constraint

```
>>> c1 = so.Constraint(x + y <= 5, name='c1')
>>> m.include(c1)
```

Adding an existing set of variables

```
>>> z = so.VariableGroup(3, 5, name='z', ub=10)
>>> m.include(z)
```

Adding an existing set of constraints

```
>>> c2 = so.ConstraintGroup((x + 2 * z[i, j] >= 2 for i in range(3)
                             for j in range(5)), name='c2')
>>> m.include(c2)
```

Adding an existing model (including all of its elements)

```
>>> new_model = so.Model(name='new_model')
>>> new_model.include(m)
```

Solver calls

<code>Model.solve(self, **kwargs)</code>	Solves the model by calling CAS or SAS optimization solvers
<code>Model.tune_parameters(self, **kwargs)</code>	Tunes the model to find ideal solver parameters
<code>Model.get_solution(self[, vtype, solution, ...])</code>	Returns the primal and dual problem solutions
<code>Model.get_variable_value(self, var)</code>	Returns the value of a variable
<code>Model.get_objective_value(self)</code>	Returns the optimal objective value
<code>Model.get_solution_summary(self)</code>	Returns the solution summary table to the user
<code>Model.get_problem_summary(self)</code>	Returns the problem summary table to the user
<code>Model.get_tuner_results(self)</code>	Returns the tuning results
<code>Model.print_solution(self)</code>	Prints the current values of the variables
<code>Model.clear_solution(self)</code>	Clears the cached solution of the model

sasoptpy.Model.solve

`Model.solve(self, **kwargs)`

Solves the model by calling CAS or SAS optimization solvers

Parameters

options [dict, optional] Solver options as a dictionary object

submit [boolean, optional] When set to *True*, calls the solver

name [string, optional] Name of the table

frame [boolean, optional] When set to *True*, uploads the problem as a DataFrame in MPS format

drop [boolean, optional] When set to *True*, drops the MPS table after solve (only CAS)

replace [boolean, optional] When set to *True*, replaces an existing MPS table (only CAS and MPS)

primalin [boolean, optional] When set to *True*, uses initial values (only MILP)

verbose [boolean, optional (experimental)] When set to *True*, prints the generated OPTMODEL code

Returns

solution [`pandas.DataFrame`] Solution of the optimization model

Notes

- Some of the options listed under the `options` argument might not be passed, depending on which CAS action is being used.
- The `option` argument should be a dictionary, where keys are option names. For example, `m.solve(options={'maxtime': 600})` limits the solution time to 600 seconds.
- See [Solver Options](#) for a list of solver options.

Examples

```
>>> m.solve()
NOTE: Initialized model food_manufacture_1
NOTE: Converting model food_manufacture_1 to DataFrame
NOTE: Added action set 'optimization'.
...
NOTE: Optimal.
NOTE: Objective = 107842.59259.
NOTE: The Dual Simplex solve time is 0.01 seconds.
```

```
>>> m.solve(options={'maxtime': 600})
```

```
>>> m.solve(options={'algorithm': 'ipm'})
```

sasoptpy.Model.tune_parameters

`Model.tune_parameters(self, **kwargs)`

Tunes the model to find ideal solver parameters

Parameters

kwargs : Keyword arguments as defined in the optimization.tuner action.

Acceptable values are:

- **milpParameters** : Parameters for the solveMilp action, such as *maxTime*, *heuristics*, *feasTol*
- **tunerParameters** : Parameters for the tuner itself, such as *maxConfigs*, *printLevel*, *logFreq*
- **tuningParameters** : List of parameters to be tuned, such as *cutStrategy*, *presolver*, *restarts*

Returns

tunerResults [`swat.dataframe.SASDataFrame`] Tuning results as a table

See also:

`Model.get_tuner_results()`

Notes

- See [SAS Optimization documentation](#) for a full list of tunable parameters.
- See [Optimization Action Set documentation](#).

Examples

```
>>> m = so.Model(name='model1')
>>> ...
>>> results = m.tune_parameters(tunerParameters={'maxConfigs': 10})
NOTE: Initialized model knapsack_with_tuner.
NOTE: Added action set 'optimization'.
NOTE: Uploading the problem DataFrame to the server.
NOTE: Cloud Analytic Services made the uploaded file available as table KNAPSACK_
↳WITH_TUNER in caslib CASUSER(casuser).
NOTE: The table KNAPSACK_WITH_TUNER has been created in caslib CASUSER(casuser)
↳from binary data uploaded to Cloud Analytic Services.
NOTE: Start to tune the MILP
```

sasoptpy.Model.get_solution

`Model.get_solution(self, vtype='Primal', solution=None, pivot=False)`

Returns the primal and dual problem solutions

Parameters

vtype [string, optional] *Primal* or *Dual*

solution [integer, optional] Solution number to be returned (for the MILP solver)

pivot [boolean, optional] When set to *True*, returns multiple solutions in columns as a pivot table

Returns

solution [`pandas.DataFrame`] Primal or dual solution table returned from the CAS action

Notes

- If the `Model.solve()` method is used with `frame=True` parameter, the MILP solver returns multiple solutions. You can retrieve different results by using the `solution` parameter.

Examples

```
>>> m.solve()
>>> print(m.get_solution('Primal'))
      var    lb    ub  value  solution
0  x[clock]  0.0  1.797693e+308  0.0      1.0

```

sasoptpy.Model.get_variable_value`Model.get_variable_value(self, var)`

Returns the value of a variable

Parameters**var** [*Variable* or string] Variable reference**Notes**

- It is possible to get a variable's value by using the *Variable.get_value()* method, as long as the variable is not abstract.
- This method is a wrapper around *Variable.get_value()* and an overlook function for model components.

sasoptpy.Model.get_objective_value`Model.get_objective_value(self)`

Returns the optimal objective value

Returns**objective_value** [float] Optimal objective value at current solution**Notes**

- This method should be used for getting the objective value after solve.
- In order to get the current value of the objective after changing variable values, you can use `m.get_objective().get_value()`.

Examples

```
>>> m.solve()
>>> print(m.get_objective_value())
42.0
```

sasoptpy.Model.get_solution_summary`Model.get_solution_summary(self)`

Returns the solution summary table to the user

Returns

ss [*swat.dataframe.SASDataFrame*] Solution summary table, that is obtained after *Model.solve()*

Examples

```
>>> m.solve()
>>> soln = m.get_solution_summary()
>>> print(type(soln))
<class 'swat.dataframe.SASDataFrame'>
```

```
>>> print(soln)
Solution Summary
                                Value
Label
Solver                               LP
Algorithm          Dual Simplex
Objective Function          obj
Solution Status          Optimal
Objective Value              10
Primal Infeasibility        0
Dual Infeasibility          0
Bound Infeasibility         0
Iterations                  2
Presolve Time              0.00
Solution Time              0.01
```

```
>>> print(soln.index)
Index(['Solver', 'Algorithm', 'Objective Function', 'Solution Status',
      'Objective Value', '', 'Primal Infeasibility',
      'Dual Infeasibility', 'Bound Infeasibility', '', 'Iterations',
      'Presolve Time', 'Solution Time'],
      dtype='object', name='Label')
```

```
>>> print(soln.loc['Solution Status', 'Value'])
Optimal
```

sasoptpy.Model.get_problem_summary

`Model.get_problem_summary(self)`

Returns the problem summary table to the user

Returns

`ps` [`swat.dataframe.SASDataFrame`] Problem summary table, that is obtained after `Model.solve()`

Examples

```
>>> m.solve()
>>> ps = m.get_problem_summary()
>>> print(type(ps))
<class 'swat.dataframe.SASDataFrame'>
```

```
>>> print(ps)
Problem Summary
                                Value
```

(continues on next page)

(continued from previous page)

Label	
Problem Name	modell
Objective Sense	Maximization
Objective Function	obj
RHS	RHS
Number of Variables	2
Bounded Above	0
Bounded Below	2
Bounded Above and Below	0
Free	0
Fixed	0
Number of Constraints	2
LE (<=)	1
EQ (=)	0
GE (>=)	1
Range	0
Constraint Coefficients	4

```
>>> print(ps.index)
Index(['Problem Name', 'Objective Sense', 'Objective Function', 'RHS',
      '', 'Number of Variables', 'Bounded Above', 'Bounded Below',
      'Bounded Above and Below', 'Free', 'Fixed', '',
      'Number of Constraints', 'LE (<=)', 'EQ (=)', 'GE (>=)', 'Range', '',
      'Constraint Coefficients'],
      dtype='object', name='Label')
```

```
>>> print(ps.loc['Number of Variables'])
Value      2
Name: Number of Variables, dtype: object
```

```
>>> print(ps.loc['Constraint Coefficients', 'Value'])
4
```

sasoptpy.Model.get_tuner_results

`Model.get_tuner_results(self)`

Returns the tuning results

Returns

tunerResults [dict] Returns tuner results as a dictionary.

Its members are

- Performance Information
- Tuner Information
- Tuner Summary
- Tuner Results

See also:

`Model.tune_parameters()`

Examples

```
>>> m.tune_parameters(tunerParameters={'maxConfigs': 10})
>>> results = m.get_tuner_results()
```

`sasoptpy.Model.print_solution`

`Model.print_solution(self)`

Prints the current values of the variables

See also:

`Model.get_solution()`

Notes

- This function might not work for abstract variables and nonlinear models.

Examples

```
>>> m.solve()
>>> m.print_solution()
x: 2.0
y: 0.0
```

`sasoptpy.Model.clear_solution`

`Model.clear_solution(self)`

Clears the cached solution of the model

Notes

- This method cleans the optimal objective value and solution time parameters of the model.

Export

<i><code>Model.to_mps(self, **kwargs)</code></i>	Returns the problem in MPS format
<i><code>Model.to_optmodel(self, **kwargs)</code></i>	Returns the model in OPTMODEL format

sasoptpy.Model.to_mps

`Model.to_mps(self, **kwargs)`
 Returns the problem in MPS format

Examples

```
>>> print(n.to_mps())
```

	Field1	Field2	Field3	Field4	Field5	Field6	_id_
0	NAME		n	0.0		0.0	1
1	ROWS			NaN		NaN	2
2	MIN	myobj		NaN		NaN	3
3	COLUMNS			NaN		NaN	4
4		y	myobj	2.0		NaN	5
5	RHS			NaN		NaN	6
6	RANGES			NaN		NaN	7
7	BOUNDS			NaN		NaN	8
8	FR	BND	y	NaN		NaN	9
9	ENDATA			0.0		0.0	10

sasoptpy.Model.to_optmodel

`Model.to_optmodel(self, **kwargs)`
 Returns the model in OPTMODEL format

Examples

```
>>> print(n.to_optmodel())
```

```
proc optmodel;
var y init 2;
min myobj = 2 * y;
solve;
quit;
```

Internal functions

<code>Model._is_linear(self)</code>	Checks whether the model can be written as a linear model (in MPS format)
-------------------------------------	---

sasoptpy.Model._is_linear

`Model._is_linear(self)`

Checks whether the model can be written as a linear model (in MPS format)

Returns

is_linear [boolean] True if model does not have any nonlinear components or abstract operations, False otherwise

Deprecated

Deprecated since version 1.0.0.

The following method(s) are deprecated and will be removed in future minor updates.

`Model.to_frame(self, **kwargs)`

sasoptpy.Model.to_frame

`Model.to_frame(self, **kwargs)`

5.1.2 Expression

Constructor

<code>Expression([exp, name])</code>	Creates a mathematical expression to represent model components
<code>Auxiliary(base[, prefix, suffix, operator, ...])</code>	Represents an auxiliary expression, often as a symbolic attribute
<code>Symbol(name)</code>	Represents a symbolic string, to be evaluated on server-side

sasoptpy.Expression

class Expression (*exp=None, name=None*)

Bases: `object`

Creates a mathematical expression to represent model components

Parameters

exp [`Expression`, optional] An existing expression where arguments are being passed

name [string, optional] A local name for the expression

Notes

- Two other classes (*Variable* and *Constraint*) are subclasses of this class.
- Expressions are created automatically after linear math operations with variables.
- An expression object can be called when defining constraints and other expressions.

Examples

```
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(3, name='y')
>>> e = so.Expression(exp=x + 3 * y[0] - 5 * y[1], name='exp1')
>>> print(e)
- 5.0 * y[1] + 3.0 * y[0] + x
>>> print(repr(e))
sasoptpy.Expression(exp = - 5.0 * y[1] + 3.0 * y[0] + x ,
                    name='exp1')
```

```
>>> sales = so.Variable(name='sales')
>>> material = so.Variable(name='material')
>>> profit = 5 * sales - 3 * material
>>> print(profit)
5.0 * sales - 3.0 * material
>>> print(repr(profit))
sasoptpy.Expression(exp = 5.0 * sales - 3.0 * material , name=None)
```

```
>>> import sasoptpy.abstract.math as sm
>>> f = sm.sin(x) + sm.min(y[1],1) ** 2
>>> print(type(f))
<class 'sasoptpy.core.Expression'>
>>> print(f)
sin(x) + (min(y[1] , 1)) ** (2)
```

sasoptpy.Auxiliary

class Auxiliary (*base, prefix=None, suffix=None, operator=None, value=None*)

Bases: `sasoptpy.core.expression.Expression`

Represents an auxiliary expression, often as a symbolic attribute

Parameters

- base** [*Expression*] Original owner of the auxiliary value
- prefix** [string, optional] Prefix of the expression
- suffix** [string, optional] Suffix of the expression
- operator** [string, optional] Wrapping operator
- value** [float, optional] Initial value of the symbolic object

Notes

- Auxiliary objects are for internal use

sasoptpy.Symbol

class `Symbol` (*name*)

Bases: `sasoptpy.core.expression.Expression`

Represents a symbolic string, to be evaluated on server-side

Parameters

name [string] String to be symbolized

Notes

- A Symbol object can be used for any values that does not translate to a value on client-side, but has meaning on execution. For example, `_N_` is a SAS symbol, which can be used in PROC OPTMODEL strings.

General methods

<code>Expression.set_name(self[, name])</code>	Specifies the name of the expression
<code>Expression.set_permanent(self)</code>	Converts a temporary expression into a permanent one
<code>Expression.set_temporary(self)</code>	Converts expression into a temporary expression to enable in-place operations
<code>Expression.get_name(self)</code>	Returns the name of the object
<code>Expression.get_value(self)</code>	Calculates and returns the value of the linear expression
<code>Expression.get_dual(self)</code>	Returns the dual value

sasoptpy.Expression.set_name

`Expression.set_name` (*self*, *name=None*)

Specifies the name of the expression

Parameters

name [string] Name of the expression

Returns

name [string] Name of the expression after resolving conflicts

Examples

```
>>> x = so.Variable(name='x')
>>> e = x**2 + 2*x + 1
>>> e.set_name('expansion')
```

`sasoptpy.Expression.set_permanent`

`Expression.set_permanent(self)`

Converts a temporary expression into a permanent one

Parameters

name [string, optional] Name of the expression

Returns

name [string] Name of the expression in the namespace

`sasoptpy.Expression.set_temporary`

`Expression.set_temporary(self)`

Converts expression into a temporary expression to enable in-place operations

`sasoptpy.Expression.get_name`

`Expression.get_name(self)`

Returns the name of the object

Returns

name [string] Name of the object

Examples

```
>>> m = so.Model()
>>> var1 = m.add_variables(name='x')
>>> print(var1.get_name())
x
```

`sasoptpy.Expression.get_value`

`Expression.get_value(self)`

Calculates and returns the value of the linear expression

Returns

v [float] Value of the expression

Examples

```
>>> sales = so.Variable(name='sales', init=10)
>>> material = so.Variable(name='material', init=3)
>>> profit = so.Expression(5 * sales - 3 * material)
>>> print(profit.get_value())
41
```

sasoptpy.Expression.get_dual

`Expression.get_dual(self)`

Returns the dual value

Returns

dual [float] Dual value of the object

Operations

<code>Expression.add(self, other[, sign])</code>	Combines two expressions and produces a new one
<code>Expression.copy(self[, name])</code>	Returns a copy of the <i>Expression</i> object
<code>Expression.mult(self, other)</code>	Multiplies the <i>Expression</i> by a scalar value
<code>Expression.get_member(self, key)</code>	Returns the requested member of the expression
<code>Expression.get_member_dict(self)</code>	Returns an ordered dictionary of elements
<code>Expression.get_member_value(self, key)</code>	Returns coefficient of requested member
<code>Expression.get_constant(self)</code>	Returns the constant term in the expression
<code>Expression.set_member(self, key, ref, val[, op])</code>	Adds a new member or changes an existing member
<code>Expression.set_member_value(self, key, value)</code>	Changes the coefficient of the requested member
<code>Expression.add_to_member_value(self, key, value)</code>	Adds <i>value</i> to the coefficient of the requested member
<code>Expression.mult_member_value(self, key, value)</code>	Multiplies the coefficient of the requested member by the specified <i>value</i>
<code>Expression.copy_member(self, key, exp)</code>	Copies the member of another expression
<code>Expression.delete_member(self, key)</code>	Deletes the requested member from the core dictionary

sasoptpy.Expression.add

`Expression.add(self, other, sign=1)`

Combines two expressions and produces a new one

Parameters

other [float or *Expression*] Second expression or constant value to be added

sign [int, optional] Sign of the addition, 1 or -1

Returns

r [*Expression*] Reference to the outcome of the operation

Notes

- It is preferable to use regular Python operation, instead of calling this method:

```
>>> e = x - y
>>> f = 3 * x + 2 * y
>>> g = e + f
>>> print(g)
4 * x + y
```

sasoptpy.Expression.copy

`Expression.copy(self, name=None)`

Returns a copy of the *Expression* object

Parameters

name [string, optional] Name for the copy

Returns

r [*Expression*] Copy of the object

Examples

```
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(1, name='y')
>>> e = so.Expression(7 * x - y[0], name='e')
>>> print(repr(e))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='e')
>>> f = e.copy(name='f')
>>> print(repr(f))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='f')
```

sasoptpy.Expression.mult

`Expression.mult(self, other)`

Multiplies the *Expression* by a scalar value

Parameters

other [*Expression* or int] Second expression to be multiplied

Returns

r [*Expression*] A new *Expression* that represents the multiplication

Notes

- This method is mainly for internal use.
- It is preferable to use regular Python operation, instead of calling this method:

```
>>> e = 3 * (x-y)
>>> f = 3
>>> g = e*f
>>> print(g)
9 * x - 9 * y
```

sasoptpy.Expression.get_member

`Expression.get_member(self, key)`

Returns the requested member of the expression

Parameters

key [string] Identifier of the member, name for single objects

Returns

member [dict] A dictionary of coefficient, operator, and reference of member

sasoptpy.Expression.get_member_dict

`Expression.get_member_dict(self)`

Returns an ordered dictionary of elements

sasoptpy.Expression.get_member_value

`Expression.get_member_value(self, key)`

Returns coefficient of requested member

Parameters

key [string] Identifier of the member

Returns

value [float] Coefficient value of the requested member

sasoptpy.Expression.get_constant

`Expression.get_constant(self)`

Returns the constant term in the expression

Examples

```
>>> x = so.Variable(name='x')
>>> e = 2 * x + 5
>>> print(e.get_constant())
5
```

sasoptpy.Expression.set_member

`Expression.set_member(self, key, ref, val, op=None)`

Adds a new member or changes an existing member

Parameters

- key** [string] Identifier of the new or existing member
- ref** [Object] A reference to the new or existing member
- val** [float] Initial coefficient of the new or existing member
- op** [string, optional] Operator, if member has multiple children

sasoptpy.Expression.set_member_value

`Expression.set_member_value(self, key, value)`

Changes the coefficient of the requested member

Parameters

- key** [string] Identifier of the member
- value** [float] New coefficient value of the member

sasoptpy.Expression.add_to_member_value

`Expression.add_to_member_value(self, key, value)`

Adds *value* to the coefficient of the requested member

Parameters

- key** [string] Identifier of the member
- value** [float] Value to be added

sasoptpy.Expression.mult_member_value

`Expression.mult_member_value(self, key, value)`

Multiplies the coefficient of the requested member by the specified *value*

Parameters

- key** [string] Identifier of the member
- value** [float] Value to be multiplied with

sasoptpy.Expression.copy_member

`Expression.copy_member(self, key, exp)`

Copies the member of another expression

Parameters

key [string] Identifier of the member

exp [*Expression*] Other expression to be copied from

sasoptpy.Expression.delete_member

`Expression.delete_member(self, key)`

Deletes the requested member from the core dictionary

Class methods

Expression.to_expression(obj)

sasoptpy.Expression.to_expression

classmethod `Expression.to_expression(obj)`

Private Methods

<i>Expression._expr(self)</i>	Generates the OPTMODEL-compatible string representation of the object
<i>Expression._is_linear(self)</i>	Checks whether the expression is composed of linear components
<i>Expression._relational(self, other, direction_)</i>	Creates a logical relation between <i>Expression</i> objects
<i>Expression.__repr__(self)</i>	Returns a string representation of the object
<i>Expression.__str__(self)</i>	Generates a representation string that is Python-compatible

sasoptpy.Expression._expr

`Expression._expr(self)`

Generates the OPTMODEL-compatible string representation of the object

Examples

```
>>> x = so.Variable(name='x')
>>> y = so.Variable(name='y')
>>> f = x + y ** 2
>>> print(f)
x + (y) ** (2)
>>> print(f._expr())
x + (y) ^ (2)
```

sasoptpy.Expression._is_linear

Expression.**_is_linear** (*self*)

Checks whether the expression is composed of linear components

Returns

is_linear [boolean] True if the expression is linear, False otherwise

Examples

```
>>> x = so.Variable()
>>> e = x*x
>>> print(e.is_linear())
False
```

```
>>> f = x*x + x*x - 2*x*x + 5
>>> print(f.is_linear())
True
```

sasoptpy.Expression._relational

Expression.**_relational** (*self*, *other*, *direction_*)

Creates a logical relation between *Expression* objects

Parameters

other [*Expression*] Expression on the other side of the relation with respect to self

direction_ [string] Direction of the logical relation, either *E*, *L*, or *G*

Returns

generated_constraint [*Constraint*] Constraint generated as a result of linear relation

sasoptpy.Expression.__repr__

Expression.__repr__(self)

Returns a string representation of the object

Examples

```
>>> x = so.Variable(name='x')
>>> y = so.Variable(name='y')
>>> f = x + y ** 2
>>> print(repr(f))
sasoptpy.Expression(exp = x + (y) ** (2), name=None)
```

sasoptpy.Expression.__str__

Expression.__str__(self)

Generates a representation string that is Python-compatible

Examples

```
>>> f = x + y ** 2
>>> print(str(f))
x + (y) ** (2)
```

5.1.3 Objective

Constructor

Objective(**kwargs)

Objective represents expressions with sense and used as target value in optimization

sasoptpy.Objective

class Objective(**kwargs)

Bases: sasoptpy.core.expression.Expression

Objective represents expressions with sense and used as target value in optimization

Parameters

exp [*Expression*] Objective as an expression

name [string] Unique name of the expression

sense [string, optional] Direction of the objective, sasoptpy.MIN (default) or sasoptpy.MAX

Examples

```
>>> m = so.Model(name='test_objective')
>>> x = m.add_variable(name='x')
>>> obj = m.set_objective(2 * x - x ** 3, sense=so.MIN, name='new_obj')
>>> str(m.get_objective())
2 * x - (x) ** (3)
>>> type(obj)
sasoptpy.Objective
```

Methods

<code>Objective.set_sense(self, sense)</code>	Specifies the objective sense (direction)
<code>Objective.get_sense(self)</code>	Returns the objective sense (direction)

sasoptpy.Objective.set_sense

`Objective.set_sense(self, sense)`
Specifies the objective sense (direction)

Parameters

sense [string] sasoptpy.MIN or sasoptpy.MAX

sasoptpy.Objective.get_sense

`Objective.get_sense(self)`
Returns the objective sense (direction)

5.1.4 Variable

Constructor

<code>Variable(**kwargs)</code>	Creates an optimization variable to be used inside models
---------------------------------	---

sasoptpy.Variable

class Variable (***kwargs*)
Bases: `sasoptpy.core.expression.Expression`
Creates an optimization variable to be used inside models

Parameters

name [string] Name of the variable
vartype [string, optional] Type of the variable
lb [float, optional] Lower bound of the variable

ub [float, optional] Upper bound of the variable

init [float, optional] Initial value of the variable

abstract [boolean, optional] When set to *True*, indicates that the variable is abstract

See also:

`sasoptpy.Model.add_variable()`

Examples

```
>>> x = so.Variable(name='x', lb=0, ub=20, vartype=so.CONT)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=0, ub=20, vartype='CONT')
```

```
>>> y = so.Variable(name='y', init=1, vartype=so.INT)
>>> print(repr(y))
sasoptpy.Variable(name='y', lb=0, ub=inf, init=1, vartype='INT')
```

Attributes

lb Lower bound of the variable

ub Upper bound of the variable

Methods

<code>Variable.set_bounds(self, \[*[, lb, ub])</code>	Changes bounds on a variable
<code>Variable.set_init(self[, init])</code>	Changes initial value of a variable
<code>Variable.get_type(self)</code>	Returns the type of variable
<code>Variable.get_attributes(self)</code>	Returns an ordered dictionary of main attributes

`sasoptpy.Variable.set_bounds`

`Variable.set_bounds` (*self*, *, *lb=None*, *ub=None*)

Changes bounds on a variable

Parameters

lb [float or *Expression*] Lower bound of the variable

ub [float or *Expression*] Upper bound of the variable

Examples

```
>>> x = so.Variable(name='x', lb=0, ub=20)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=0, ub=20, vartype='CONT')
>>> x.set_bounds(lb=5, ub=15)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=5, ub=15, vartype='CONT')
```

sasoptpy.Variable.set_init

`Variable.set_init(self, init=None)`

Changes initial value of a variable

Parameters

init [float or None] Initial value of the variable

Examples

```
>>> x = so.Variable(name='x')
>>> x.set_init(5)

>>> y = so.Variable(name='y', init=3)
>>> y.set_init()
```

sasoptpy.Variable.get_type

`Variable.get_type(self)`

Returns the type of variable

Valid values are:

- *sasoptpy.CONT*
- *sasoptpy.INT*
- *sasoptpy.BIN*

sasoptpy.Variable.get_attributes

`Variable.get_attributes(self)`

Returns an ordered dictionary of main attributes

Returns

attributes [OrderedDict] Dictionary consists of *init*, *lb*, and *ub* attributes

Inherited Methods

<code>Variable.copy(self[, name])</code>	Returns a copy of the <i>Expression</i> object
<code>Variable.get_dual(self)</code>	Returns the dual value
<code>Variable.get_name(self)</code>	Returns the name of the object
<code>Variable.get_value(self)</code>	Returns the value of the variable

sasoptpy.Variable.copy

`Variable.copy(self, name=None)`

Returns a copy of the *Expression* object

Parameters

name [string, optional] Name for the copy

Returns

r [*Expression*] Copy of the object

Examples

```
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(1, name='y')
>>> e = so.Expression(7 * x - y[0], name='e')
>>> print(repr(e))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='e')
>>> f = e.copy(name='f')
>>> print(repr(f))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='f')
```

sasoptpy.Variable.get_dual

`Variable.get_dual(self)`

Returns the dual value

Returns

dual [float] Dual value of the object

sasoptpy.Variable.get_name

`Variable.get_name(self)`

Returns the name of the object

Returns

name [string] Name of the object

Examples

```
>>> m = so.Model()
>>> var1 = m.add_variables(name='x')
>>> print(var1.get_name())
x
```

sasoptpy.Variable.get_value

`Variable.get_value(self)`

Returns the value of the variable

Returns

value [float] Value of the variable

Examples

```
>>> x.set_value(20)
>>> x.get_value()
20
```

5.1.5 Variable Group

Constructor

<code>VariableGroup(**kwargs)</code>	Creates a group of <i>Variable</i> objects
--------------------------------------	--

sasoptpy.VariableGroup

class `VariableGroup(**kwargs)`

Bases: `sasoptpy.core.group.Group`

Creates a group of *Variable* objects

Parameters

argv [list, dict, int, `pandas.Index`] Loop index for variable group

name [string, optional] Name (prefix) of the variables

vartype [string, optional] Type of variables, *BIN*, *INT*, or *CONT*

lb [list, dict, `pandas.Series`, optional] Lower bounds of variables

ub [list, dict, `pandas.Series`, optional] Upper bounds of variables

init [float, optional] Initial values of variables

See also:

`sasoptpy.Model.add_variables()`

`sasoptpy.Model.include()`

Notes

- When working with a single model, use the `sasoptpy.Model.add_variables()` method.
- If a variable group object is created, it can be added to a model using the `sasoptpy.Model.include()` method.
- An individual variable inside the group can be accessed using indices.

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> print(repr(z[0, 'a']))
sasoptpy.Variable(name='z_0_a', lb=0, ub=10, vartype='CONT')
```

Examples

```
>>> PERIODS = ['Period1', 'Period2', 'Period3']
>>> production = so.VariableGroup(PERIODS, vartype=so.INT,
                                name='production', lb=10)

>>> print(production)
Variable Group (production) [
  [Period1: production['Period1']]
  [Period2: production['Period2']]
  [Period3: production['Period3']]
]
```

```
>>> x = so.VariableGroup(4, vartype=so.BIN, name='x')
>>> print(x)
Variable Group (x) [
  [0: x[0]]
  [1: x[1]]
  [2: x[2]]
  [3: x[3]]
]
```

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z')
>>> print(z)
Variable Group (z) [
  [(0, 'a'): z[0, 'a']]
  [(0, 'b'): z[0, 'b']]
  [(0, 'c'): z[0, 'c']]
  [(1, 'a'): z[1, 'a']]
  [(1, 'b'): z[1, 'b']]
  [(1, 'c'): z[1, 'c']]
]
>>> print(repr(z))
sasoptpy.VariableGroup([0, 1], ['a', 'b', 'c'], name='z')
```

Methods

<code>VariableGroup.get_name(self)</code>	Returns the name of the variable group
<code>VariableGroup.get_attributes(self)</code>	Returns an ordered dictionary of main attributes
<code>VariableGroup.get_type(self)</code>	Returns the type of variable
<code>VariableGroup.get_members(self)</code>	Returns a dictionary of members
<code>VariableGroup.set_bounds(self[, lb, ub, members])</code>	Specifies or updates bounds for the variable group
<code>VariableGroup.set_init(self, init)</code>	Specifies or updates the initial values
<code>VariableGroup.mult(self, vector)</code>	Quick multiplication method for the variable groups
<code>VariableGroup.sum(self, *argv)</code>	Quick sum method for the variable groups

sasoptpy.VariableGroup.get_name

`VariableGroup.get_name(self)`
Returns the name of the variable group

Returns

name [string] Name of the variable group

Examples

```
>>> m = so.Model(name='m')
>>> var1 = m.add_variables(4, name='x')
>>> print(var1.get_name())
x
```

sasoptpy.VariableGroup.get_attributes

`VariableGroup.get_attributes(self)`
Returns an ordered dictionary of main attributes

Returns

attributes [OrderedDict] The dictionary consists of *init*, *lb*, and *ub* attributes

sasoptpy.VariableGroup.get_type

`VariableGroup.get_type(self)`
Returns the type of variable

Possible values are:

- `sasoptpy.CONT`
- `sasoptpy.INT`
- `sasoptpy.BIN`

Examples

```
>>> z = so.VariableGroup(3, name='z', vartype=so.INT)
>>> z.get_type()
'INT'
```

sasoptpy.VariableGroup.get_members

`VariableGroup.get_members(self)`
Returns a dictionary of members

sasoptpy.VariableGroup.set_bounds

`VariableGroup.set_bounds(self, lb=None, ub=None, members=True)`
Specifies or updates bounds for the variable group

Parameters

lb [float, `pandas.Series`, optional] Lower bound

ub [float, `pandas.Series`, optional] Upper bound

Examples

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> print(repr(z[0, 'a']))
sasoptpy.Variable(name='z_0_a', lb=0, ub=10, vartype='CONT')
>>> z.set_bounds(lb=3, ub=5)
>>> print(repr(z[0, 'a']))
sasoptpy.Variable(name='z_0_a', lb=3, ub=5, vartype='CONT')
```

```
>>> u = so.VariableGroup(['a', 'b', 'c', 'd'], name='u')
>>> lb_vals = pd.Series([1, 4, 0, -1], index=['a', 'b', 'c', 'd'])
>>> u.set_bounds(lb=lb_vals)
>>> print(repr(u['b']))
sasoptpy.Variable(name='u_b', lb=4, ub=inf, vartype='CONT')
```

sasoptpy.VariableGroup.set_init

`VariableGroup.set_init(self, init)`
Specifies or updates the initial values

Parameters

init [float, list, dict, `pandas.Series`] Initial value of the variables

Examples

```
>>> m = so.Model(name='m')
>>> y = m.add_variables(3, name='y')
>>> print(y._defn())
var y {{0,1,2}};
>>> y.set_init(5)
>>> print(y._defn())
var y {{0,1,2}} init 5;
```

sasoptpy.VariableGroup.mult

`VariableGroup.mult` (*self*, *vector*)

Quick multiplication method for the variable groups

Parameters

vector [list, dictionary, `pandas.Series`, or `pandas.DataFrame`] Vector to be multiplied with the variable group

Returns

r [*Expression*] An expression that is the product of the variable group with the specified vector

Examples

Multiplying with a list

```
>>> x = so.VariableGroup(4, vartype=so.BIN, name='x')
>>> e1 = x.mult([1, 5, 6, 10])
>>> print(e1)
10.0 * x[3] + 6.0 * x[2] + x[0] + 5.0 * x[1]
```

Multiplying with a dictionary

```
>>> y = so.VariableGroup([0, 1], ['a', 'b'], name='y', lb=0, ub=10)
>>> dvals = {(0, 'a'): 1, (0, 'b'): 2, (1, 'a'): -1, (1, 'b'): 5}
>>> e2 = y.mult(dvals)
>>> print(e2)
2.0 * y[0, 'b'] - y[1, 'a'] + y[0, 'a'] + 5.0 * y[1, 'b']
```

Multiplying with a `pandas.Series` object

```
>>> u = so.VariableGroup(['a', 'b', 'c', 'd'], name='u')
>>> ps = pd.Series([0.1, 1.5, -0.2, 0.3], index=['a', 'b', 'c', 'd'])
>>> e3 = u.mult(ps)
>>> print(e3)
1.5 * u['b'] + 0.1 * u['a'] - 0.2 * u['c'] + 0.3 * u['d']
```

Multiplying with a `pandas.DataFrame` object

```
>>> data = np.random.rand(3, 3)
>>> df = pd.DataFrame(data, columns=['a', 'b', 'c'])
>>> print(df)
```

(continues on next page)

(continued from previous page)

```

NOTE: Initialized model model1
      a          b          c
0  0.966524  0.237081  0.944630
1  0.821356  0.074753  0.345596
2  0.065229  0.037212  0.136644
>>> y = m.add_variables(3, ['a', 'b', 'c'], name='y')
>>> e = y.mult(df)
>>> print(e)
0.9665237354418064 * y[0, 'a'] + 0.23708064143289442 * y[0, 'b'] +
0.944629500537536 * y[0, 'c'] + 0.8213562592159828 * y[1, 'a'] +
0.07475256894157478 * y[1, 'b'] + 0.3455957019116668 * y[1, 'c'] +
0.06522945752546017 * y[2, 'a'] + 0.03721153533250843 * y[2, 'b'] +
0.13664422498043194 * y[2, 'c']

```

sasoptpy.VariableGroup.sum

VariableGroup.**sum**(*self*, *argv)

Quick sum method for the variable groups

Parameters

argv [Arguments] List of indices for the sum

Returns

r [*Expression*] Expression that represents the sum of all variables in the group

Examples

```

>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> e1 = z.sum('*', '*')
>>> print(e1)
z[1, 'c'] + z[1, 'a'] + z[1, 'b'] + z[0, 'a'] + z[0, 'b'] +
z[0, 'c']
>>> e2 = z.sum('*', 'a')
>>> print(e2)
z[1, 'a'] + z[0, 'a']
>>> e3 = z.sum('*', ['a', 'b'])
>>> print(e3)
z[1, 'a'] + z[0, 'b'] + z[1, 'b'] + z[0, 'a']

```

5.1.6 Constraint

Constructor

Constraint(**kwargs)

Creates a linear or quadratic constraint for optimization models

sasoptpy.Constraint

class Constraint (**kwargs)

Bases: `sasoptpy.core.expression.Expression`

Creates a linear or quadratic constraint for optimization models

Constraints should be created by adding logical relations to *Expression* objects.

Parameters

exp [*Expression*] A logical expression that forms the constraint

direction [string, optional] Direction of the logical expression

Possible values are

- *E* for equality (=) constraints
- *L* for less than or equal to (<=) constraints
- *G* for greater than or equal to (>=) constraints

name [string, optional] Name of the constraint object

crange [float, optional] Range for ranged constraints

See also:

sasoptpy.Model.add_constraint()

Notes

- A constraint can be generated in two different ways:
 - Using the *sasoptpy.Model.add_constraint()* method

```
>>> m = so.Model(name='m')
>>> c1 = m.add_constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
```

- Using the constructor

```
>>> c1 = sasoptpy.Constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
```

- The same constraint can be included into other models using the *Model.include()* method.

Examples

```
>>> x = so.Variable(name='x')
>>> y = so.Variable(name='y')
>>> c1 = so.Constraint( 3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
```

```
>>> c2 = so.Constraint( - x + 2 * y - 5, direction='L', name='c2')
sasoptpy.Constraint( - x + 2.0 * y <= 5, name='c2')
```

Methods

<code>Constraint.get_value(self[, rhs])</code>	Returns the current value of the constraint
<code>Constraint.get_dual(self)</code>	Returns the dual value if exists
<code>Constraint.set_block(self, block_number)</code>	Sets the decomposition block number for a constraint
<code>Constraint.set_direction(self, direction)</code>	Changes the direction of a constraint
<code>Constraint.set_rhs(self, value)</code>	Changes the constant value (right-hand side) of a constraint
<code>Constraint.update_var_coef(self, var, value)</code>	Updates the coefficient of a variable inside the constraint

sasoptpy.Constraint.get_value

`Constraint.get_value(self, rhs=False)`

Returns the current value of the constraint

Parameters

rhs [boolean, optional] When set to *True*, includes constant values to the value of the constraint. Default is *False*.

Examples

```
>>> x = so.Variable(name='x', init=2)
>>> c = so.Constraint(x ** 2 + 2 * x <= 15, name='c')
>>> print(c.get_value())
8
>>> print(c.get_value(rhs=True))
-7
```

sasoptpy.Constraint.get_dual

`Constraint.get_dual(self)`
Returns the dual value if exists

Returns

dual [float] Dual value of the constraint

sasoptpy.Constraint.set_block

`Constraint.set_block(self, block_number)`
Sets the decomposition block number for a constraint

Parameters

block_number [int] Block number of the constraint

Examples

```
>>> c1 = m.add_constraints((x + 2 * y[i] <= 5 for i in NODES),
                           name='c1')
>>> for i in NODES:
    c1[i].set_block(i)
```

sasoptpy.Constraint.set_direction

`Constraint.set_direction(self, direction)`
Changes the direction of a constraint

Parameters

direction [string] Direction of the constraint

Possible values are

- *E* for equality (=) constraints
- *L* for less than or euqal to (<=) constraints
- *G* for greater than or equal to (>=) constraints

Examples

```
>>> c1 = so.Constraint(exp=3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( 3.0 * x - 5.0 * y <= 10, name='c1')
>>> c1.set_direction('G')
>>> print(repr(c1))
sasoptpy.Constraint( 3.0 * x - 5.0 * y >= 10, name='c1')
```

`sasoptpy.Constraint.set_rhs`

`Constraint.set_rhs(self, value)`

Changes the constant value (right-hand side) of a constraint

Parameters

value [float] New right-hand side value for the constraint

Examples

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> c = m.add_constraint(x + 3*y <= 10, name='con_1')
>>> print(c)
x + 3.0 * y <= 10
>>> c.set_rhs(5)
>>> print(c)
x + 3.0 * y <= 5
```

`sasoptpy.Constraint.update_var_coef`

`Constraint.update_var_coef(self, var, value)`

Updates the coefficient of a variable inside the constraint

Parameters

var [*Variable*] Variable to be updated

value [float] Coefficient of the variable in the constraint

See also:

`sasoptpy.Model.set_coef()`

Examples

```
>>> c1 = so.Constraint(exp=3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
>>> c1.update_var_coef(x, -1)
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y - x <= 10, name='c1')
```

5.1.7 Constraint Group

Constructor

<code>ConstraintGroup(**kwargs)</code>	Creates a group of <i>Constraint</i> objects
--	--

sasoptpy.ConstraintGroup

class `ConstraintGroup` (***kwargs*)

Bases: `sasoptpy.core.group.Group`

Creates a group of *Constraint* objects

Parameters

argv [Generator-type object] A Python generator that includes *Expression* objects

name [string, optional] Name (prefix) of the constraints

See also:

`sasoptpy.Model.add_constraints()`

`sasoptpy.Model.include()`

Notes

Use `sasoptpy.Model.add_constraints()` when working with a single model.

Examples

```
>>> var_ind = ['a', 'b', 'c', 'd']
>>> u = so.VariableGroup(var_ind, name='u')
>>> t = so.Variable(name='t')
>>> cg = so.ConstraintGroup((u[i] + 2 * t <= 5 for i in var_ind), name='cg')
>>> print(cg)
Constraint Group (cg) [
  [a: 2.0 * t + u['a'] <= 5]
  [b: u['b'] + 2.0 * t <= 5]
  [c: 2.0 * t + u['c'] <= 5]
  [d: 2.0 * t + u['d'] <= 5]
]
```

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> cg2 = so.ConstraintGroup((2 * z[i, j] + 3 * z[i-1, j] >= 2 for i in
                             [1] for j in ['a', 'b', 'c']), name='cg2')
>>> print(cg2)
Constraint Group (cg2) [
  [(1, 'a'): 3.0 * z[0, 'a'] + 2.0 * z[1, 'a'] >= 2]
  [(1, 'b'): 2.0 * z[1, 'b'] + 3.0 * z[0, 'b'] >= 2]
  [(1, 'c'): 2.0 * z[1, 'c'] + 3.0 * z[0, 'c'] >= 2]
]
```

Methods

<code>ConstraintGroup.get_name(self)</code>	Returns the name of the constraint group
<code>ConstraintGroup.get_all_keys(self)</code>	Returns a list of all keys (indices) in the group
<code>ConstraintGroup.get_expressions(self[, rhs])</code>	Returns constraints as a list of expressions
<code>ConstraintGroup.get_members(self)</code>	Returns a dictionary of members

`sasoptpy.ConstraintGroup.get_name`

`ConstraintGroup.get_name(self)`
Returns the name of the constraint group

Returns

name [string] Name of the constraint group

Examples

```
>>> m = so.Model(name='m')
>>> x = m.add_variable(name='x')
>>> indices = ['a', 'b', 'c']
>>> y = m.add_variables(indices, name='y')
>>> c1 = m.add_constraints((x + y[i] <= 4 for i in indices),
                           name='con1')
>>> print(c1.get_name())
con1
```

`sasoptpy.ConstraintGroup.get_all_keys`

`ConstraintGroup.get_all_keys(self)`
Returns a list of all keys (indices) in the group

`sasoptpy.ConstraintGroup.get_expressions`

`ConstraintGroup.get_expressions(self, rhs=False)`
Returns constraints as a list of expressions

Parameters

rhs [boolean, optional] When set to *True*, passes the the constant part (rhs) of the constraint

Returns

df [`pandas.DataFrame`] Returns a DataFrame that consists of constraints as expressions

Examples

```
>>> m = so.Model(name='m')
>>> var_ind = ['a', 'b', 'c', 'd']
>>> u = m.add_variables(var_ind, name='u')
>>> t = m.add_variable(name='t')
>>> cg = so.ConstraintGroup((u[i] + 2 * t <= 5 for i in var_ind),
                             name='cg')
>>> ce = cg.get_expressions()
>>> print(ce)
              cg
a  u[a] + 2 * t
b  u[b] + 2 * t
c  u[c] + 2 * t
d  u[d] + 2 * t
>>> ce_rhs = cg.get_expressions(rhs=True)
>>> print(ce_rhs)
              cg
a  u[a] + 2 * t - 5
b  u[b] + 2 * t - 5
c  u[c] + 2 * t - 5
d  u[d] + 2 * t - 5
```

sasoptpy.ConstraintGroup.get_members

`ConstraintGroup.get_members(self)`

Returns a dictionary of members

5.1.8 Workspace

Constructor

Workspace(name[, session])

Workspace represents an OPTMODEL block that allows multiple solves

sasoptpy.Workspace

class `Workspace` (name, session=None)

Bases: `object`

Workspace represents an OPTMODEL block that allows multiple solves

Parameters

name [string] Name of the workspace

session [`saspy.SASsession` or `swat.cas.connection.CAS`, optional] Session to be submitted

Methods

<code>Workspace.get_elements(self)</code>	Returns a list of elements in the workspace
<code>Workspace.set_active_model(self, model)</code>	Marks the specified model as active; to be used in solve statements
<code>Workspace.append(self, element)</code>	Appends a new element (operation or statement) to the workspace
<code>Workspace.submit(self, <i>**kwargs</i>)</code>	Submits the workspace as an OPTMODEL block and returns solutions
<code>Workspace.parse_solve_responses(self)</code>	Retrieves the solutions to all solve statements
<code>Workspace.parse_print_responses(self)</code>	Retrieves responses to all print statements
<code>Workspace.get_variable(self, name)</code>	Obtains the value of a specified variable name
<code>Workspace.set_variable_value(self, name, value)</code>	Specifies the value of a variable
<code>Workspace.to_optmodel(self)</code>	Returns equivalent OPTMODEL code of the workspace

`sasoptpy.Workspace.get_elements`

`Workspace.get_elements(self)`
Returns a list of elements in the workspace

`sasoptpy.Workspace.set_active_model`

`Workspace.set_active_model(self, model)`
Marks the specified model as active; to be used in solve statements

Parameters

model [*Model*] Model to be activated

`sasoptpy.Workspace.append`

`Workspace.append(self, element)`
Appends a new element (operation or statement) to the workspace

Parameters

element [*sasoptpy.abstract.Statement*] Any statement that can be appended

`sasoptpy.Workspace.submit`

`Workspace.submit(self, **kwargs)`
Submits the workspace as an OPTMODEL block and returns solutions

sasoptpy.Workspace.parse_solve_responses

`Workspace.parse_solve_responses (self)`
Retrieves the solutions to all solve statements

sasoptpy.Workspace.parse_print_responses

`Workspace.parse_print_responses (self)`
Retrieves responses to all print statements

sasoptpy.Workspace.get_variable

`Workspace.get_variable (self, name)`
Obtains the value of a specified variable name

Parameters

name [string] Name of the variable

sasoptpy.Workspace.set_variable_value

`Workspace.set_variable_value (self, name, value)`
Specifies the value of a variable

Parameters

name [string] Name of the variable

value [float] New value of the variable

sasoptpy.Workspace.to_optmodel

`Workspace.to_optmodel (self)`
Returns equivalent OPTMODEL code of the workspace

Returns

optmodel [string] Generated OPTMODEL code of the workspace object

5.2 Abstract

5.2.1 Abstract

Main classes

<code>Parameter(**kwargs)</code>	Represents a problem input parameter
<code>ParameterGroup(**kwargs)</code>	Represents a group of input parameters
<code>Set(**kwargs)</code>	Creates an index set to be represented inside PROC OPTMODEL

Continued on next page

Table 25 – continued from previous page

<code>SetIterator</code> (initset[, name, datatype])	Creates an iterator object for a given Set
<code>SetIteratorGroup</code> (initset[, datatype, names])	Creates a group of set iterator objects for multi-dimensional sets
<code>Statement</code> ()	Creates a statement to be executed at the server
<code>ImplicitVar</code> (**kwargs)	Creates an implicit variable

sasoptpy.abstract.Parameter

class `Parameter` (**kwargs)

Bases: `sasoptpy.core.expression.Expression`

Represents a problem input parameter

Parameters

name [string] Name of the parameter

ptype [string, optional] Type of the parameter. Possible values are `sasoptpy.STR` and `sasoptpy.NUM`

value [float, optional] Value of the parameter

init [float, optional] Initial value of the parameter

Examples

```
>>> with so.Workspace('w') as w:
...     p = so.Parameter(name='p', init=3)
...     p.set_value(5)
...
<sasoptpy.abstract.statement.assignment.Assignment object at 0x7f7952e9bb38>
>>> print(so.to_optmodel(w))
proc optmodel;
  num p init 3;
  p = 5;
quit;
```

sasoptpy.abstract.ParameterGroup

class `ParameterGroup` (**kwargs)

Bases: `object`

Represents a group of input parameters

Parameters

index_key [iterable] Index key of the group members

name [string] Name of the parameter group

ptype [string, optional] Type of the parameters. Possible values are `sasoptpy.STR` and `sasoptpy.NUM`

value [float, optional] Value of the parameter

init [float, optional] Initial value of the parameter

Examples

```
>>> from sasoptpy.actions import for_loop
>>> with so.Workspace('w') as w:
...     p = so.ParameterGroup(so.exp_range(1, 6), name='p', init=3)
...     p[0].set_value(3)
...     S = so.Set(name='S', value=so.exp_range(1, 6))
...     for i in for_loop(S):
...         p[i].set_value(1)
...
>>> print(so.to_optmodel(w))
proc optmodel;
    num p {1..5} init 3;
    p[0] = 3;
    set S = 1..5;
    for {o13 in S} do;
        p[o13] = 1;
    end;
quit;
```

sasoptpy.abstract.Set

class `Set` (***kwargs*)

Bases: `object`

Creates an index set to be represented inside PROC OPTMODEL

Parameters

name [string] Name of the parameter

init [Expression, optional] Initial value expression of the parameter

settype [list, optional] List of types for the set, consisting of 'num' and 'str' values

Examples

```
>>> I = so.Set('I')
>>> print(I._defn())
set I;
```

```
>>> J = so.Set('J', settype=['num', 'str'])
>>> print(J._defn())
set <num, str> J;
```

```
>>> N = so.Parameter(name='N', init=5)
>>> K = so.Set('K', init=so.exp_range(1,N))
>>> print(K._defn())
set K = 1..N;
```

sasoptpy.abstract.SetIterator

class `SetIterator` (*initset*, *name=None*, *datatype=None*)

Bases: `sasoptpy.core.expression.Expression`

Creates an iterator object for a given Set

Parameters

initset [*Set*] Set to be iterated on

name [string, optional] Name of the iterator

datatype [string, optional] Type of the iterator

Notes

- `abstract.SetIterator` objects are created automatically when iterating over a `abstract.Set` object

Examples

```
>>> S = so.Set(name='S')
>>> for i in S:
...     print(i.get_name(), type(i))
o19 <class 'sasoptpy.abstract.set_iterator.SetIterator'>
```

sasoptpy.abstract.SetIteratorGroup

class `SetIteratorGroup` (*initset*, *datatype=None*, *names=None*)

Bases: `collections.OrderedDict`, `sasoptpy.core.expression.Expression`

Creates a group of set iterator objects for multi-dimensional sets

Parameters

initset [*Set*] Set to be iterated on

names [string, optional] Names of the iterators

datatype [string, optional] Types of the iterators

Examples

```
>>> T = so.Set(name='T', settype=[so.STR, so.NUM])
>>> for j in T:
...     print(j.get_name(), type(j))
...     for k in j:
...         print(k.get_name(), type(k))
o5 <class 'sasoptpy.abstract.set_iterator.SetIteratorGroup'>
o6 <class 'sasoptpy.abstract.set_iterator.SetIterator'>
o8 <class 'sasoptpy.abstract.set_iterator.SetIterator'>
```

sasoptpy.abstract.Statement

class Statement

Bases: `abc.ABC`

Creates a statement to be executed at the server

This class is an abstract base class for all statement types.

sasoptpy.abstract.ImplicitVar

class ImplicitVar(**kwargs)

Bases: `object`

Creates an implicit variable

Parameters

argv [Generator, optional] Generator object for the implicit variable

name [string, optional] Name of the implicit variable

Notes

- If the loop inside generator is over an abstract object, a definition for the object will be created inside `Model.to_optmodel()` method.

Examples

Regular Implicit Variable

```
>>> I = range(5)
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(I, name='y')
>>> z = so.ImplicitVar((x + i * y[i] for i in I), name='z')
>>> for i in z:
>>>     print(i, z[i])
(0,) x
(1,) x + y[1]
(2,) x + 2 * y[2]
(3,) x + 3 * y[3]
(4,) x + 4 * y[4]
```

Abstract Implicit Variable

```
>>> I = so.Set(name='I')
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(I, name='y')
>>> z = so.ImplicitVar((x + i * y[i] for i in I), name='z')
>>> print(z._defn())
impvar z {i_1 in I} = x + i_1 * y[i_1];
>>> for i in z:
>>>     print(i, z[i])
(sasoptpy.abstract.SetIterator(name=i_1, ...),) x + i_1 * y[i_1]
```

Statements

The following list of classes define the underlying structure for the abstract functions. See [Abstract Actions](#) to see how you can use abstract functions and statements.

<i>Assignment</i> (identifier, expression[, keyword])
<i>CoForLoopStatement</i> (*args)
<i>CreateDataStatement</i> (table, index[, columns])
<i>DropStatement</i> (**kwargs)
<i>ForLoopStatement</i> (*args)
<i>IfElseStatement</i> (logic_expression, if_statement)

sasoptpy.abstract.statement.PrintStatement**class PrintStatement** (*args)

Bases: sasoptpy.abstract.statement.statement_base.Statement

5.3 Interface

5.3.1 Interface

CAS (Viya)

<i>CASMediator</i> (caller, cas_session)	Handles the connection between sasoptpy and the SAS Viya (CAS) server
--	---

sasoptpy.interface.CASMediator**class CASMediator** (caller, cas_session)

Bases: sasoptpy.interface.solver.mediator.Mediator

Handles the connection between sasoptpy and the SAS Viya (CAS) server

Parameters**caller** [*sasoptpy.Model* or *sasoptpy.Workspace*] Model or workspace that mediator belongs to**cas_session** [*swat.cas.connection.CAS*] CAS connection**Notes**

- CAS Mediator is used by *sasoptpy.Model* and *sasoptpy.Workspace* objects internally.

Model

<i>CASMediator.solve</i> (self, <i>**kwargs</i>)	Solve action for Model objects
<i>CASMediator.tune</i> (self, <i>**kwargs</i>)	Wrapper for the MILP tuner
<i>CASMediator.tune_problem</i> (self, <i>**kwargs</i>)	Calls optimization.tuner CAS action to finds out the ideal configuration
<i>CASMediator.solve_with_mps</i> (self, <i>**kwargs</i>)	Submits the problem in MPS (DataFrame) format, supported by old versions
<i>CASMediator.solve_with_optmodel</i> (self, <i>**kwargs</i>)	Submits the problem in OPTMODEL format
<i>CASMediator.parse_cas_solution</i> (self)	Performs post-solve operations
<i>CASMediator.parse_cas_table</i> (self, table)	Converts requested <i>swat.cas.table.CASTable</i> objects to <i>swat.dataframe.SASDataFrame</i>
<i>CASMediator.set_variable_values</i> (self, solution)	Performs post-solve assignment of variable values

Continued on next page

Table 28 – continued from previous page

<code>CASMediator.set_constraint_values(self, solution)</code>	Performs post-solve assignment of constraint values
<code>CASMediator.set_model_objective_value(self, value)</code>	Performs post-solve assignment of objective values
<code>CASMediator.set_variable_init_values(self, values)</code>	Performs post-solve assignment of variable initial values
<code>CASMediator.upload_user_blocks(self)</code>	Uploads user-defined decomposition blocks to the CAS server
<code>CASMediator.upload_model(self[, name, ...])</code>	Converts internal model to MPS table and upload to CAS session

sasoptpy.interface.CASMediator.solve

`CASMediator.solve(self, **kwargs)`
Solve action for Model objects

sasoptpy.interface.CASMediator.tune

`CASMediator.tune(self, **kwargs)`
Wrapper for the MILP tuner

sasoptpy.interface.CASMediator.tune_problem

`CASMediator.tune_problem(self, **kwargs)`
Calls optimization.tuner CAS action to finds out the ideal configuration

sasoptpy.interface.CASMediator.solve_with_mps

`CASMediator.solve_with_mps(self, **kwargs)`
Submits the problem in MPS (DataFrame) format, supported by old versions

Parameters

kwargs [dict] Keyword arguments for solver settings and options

Returns

primal_solution [`swat.dataframe.SASDataFrame`] Solution of the model or None

sasoptpy.interface.CASMediator.solve_with_optmodel

`CASMediator.solve_with_optmodel(self, **kwargs)`
Submits the problem in OPTMODEL format

Parameters

kwargs [dict] Keyword arguments for solver settings and options

Returns

primal_solution [`swat.dataframe.SASDataFrame`] Solution of the model or None

sasoptpy.interface.CASMediator.parse_cas_solution

`CASMediator.parse_cas_solution(self)`

Performs post-solve operations

Returns

solution [`swat.dataframe.SASDataFrame`] Solution of the problem

sasoptpy.interface.CASMediator.parse_cas_table

`CASMediator.parse_cas_table(self, table)`

Converts requested `swat.cas.table.CASTable` objects to `swat.dataframe.SASDataFrame`

sasoptpy.interface.CASMediator.set_variable_values

`CASMediator.set_variable_values(self, solution)`

Performs post-solve assignment of variable values

Parameters

solution [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

sasoptpy.interface.CASMediator.set_constraint_values

`CASMediator.set_constraint_values(self, solution)`

Performs post-solve assignment of constraint values

Parameters

solution [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

sasoptpy.interface.CASMediator.set_model_objective_value

`CASMediator.set_model_objective_value(self)`

Performs post-solve assignment of objective values

Parameters

solution [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

sasoptpy.interface.CASMediator.set_variable_init_values

`CASMediator.set_variable_init_values(self)`

Performs post-solve assignment of variable initial values

Parameters

solution [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

sasoptpy.interface.CASMediator.upload_user_blocks`CASMediator.upload_user_blocks(self)`

Uploads user-defined decomposition blocks to the CAS server

Returns**name** [string] CAS table name of the user-defined decomposition blocks**Examples**

```
>>> userblocks = m.upload_user_blocks()
>>> m.solve(milp={'decomp': {'blocks': userblocks}})
```

sasoptpy.interface.CASMediator.upload_model`CASMediator.upload_model(self, name=None, replace=True, constant=False, verbose=False)`

Converts internal model to MPS table and upload to CAS session

Parameters**name** [string, optional] Desired name of the MPS table on the server**replace** [boolean, optional] Option to replace the existing MPS table**Returns****frame** [`swat.cas.table.CASTable`] Reference to the uploaded CAS Table**Notes**

- This method returns `None` if the model session is not valid.
- Name of the table is randomly assigned if name argument is `None` or not given.
- This method should not be used if `Model.solve()` is going to be used. `Model.solve()` calls this method internally.

Workspace

<code>CASMediator.submit(self, **kwargs)</code>	Submit action for custom input and <i>sasoptpy.Workspace</i> objects
<code>CASMediator.submit_optmodel_code(self, ...)</code>	Converts caller into OPTMODEL code and submits using <code>optimization.runOptmodel</code> action
<code>CASMediator.parse_cas_workspace_response(self)</code>	Parses results of workspace submission
<code>CASMediator.set_workspace_variable_value(self, ...)</code>	Performs post-solve assignment of <i>sasoptpy.Workspace</i> variable values

sasoptpy.interface.CASMediator.submit

`CASMediator.submit(self, **kwargs)`
Submit action for custom input and *sasoptpy.Workspace* objects

sasoptpy.interface.CASMediator.submit_optmodel_code

`CASMediator.submit_optmodel_code(self, **kwargs)`
Converts caller into OPTMODEL code and submits using `optimization.runOptmodel` action

Parameters

kwargs : Solver settings and options

sasoptpy.interface.CASMediator.parse_cas_workspace_response

`CASMediator.parse_cas_workspace_response(self)`
Parses results of workspace submission

sasoptpy.interface.CASMediator.set_workspace_variable_values

`CASMediator.set_workspace_variable_values(self, solution)`
Performs post-solve assignment of *sasoptpy.Workspace* variable values

SAS

<i>SASMediator</i> (caller, sas_session)	Handles the connection between sasoptpy and SAS instance
--	--

sasoptpy.interface.SASMediator

class SASMediator (caller, sas_session)
Bases: `sasoptpy.interface.solver.mediator.Mediator`

Handles the connection between sasoptpy and SAS instance

Parameters

caller [*sasoptpy.Model* or *sasoptpy.Workspace*] Model or workspace that mediator belongs to

sas_session [*saspy.SASsession*] SAS session object

Notes

- SASMediator is used by `sasoptpy.Model` and `sasoptpy.Workspace` objects internally.

Model

<code>SASMediator.solve(self, **kwargs)</code>	Solve action for Model objects
<code>SASMediator.solve_with_mps(self, **kwargs)</code>	Submits the problem in MPS (DataFrame) format, supported by old versions
<code>SASMediator.solve_with_optmodel(self, **kwargs)</code>	Submits the problem in OPTMODEL format
<code>SASMediator.parse_sas_mps_solution(self)</code>	Parses MPS solution after <i>solve</i> and returns solution
<code>SASMediator.parse_sas_solution(self)</code>	Performs post-solve operations
<code>SASMediator.parse_sas_table(self, table_name)</code>	Converts requested table name into <code>pandas.DataFrame</code>
<code>SASMediator.convert_to_original(self, table)</code>	Converts variable names to their original format if a placeholder gets used
<code>SASMediator.perform_postsolve_operations(self)</code>	Performs post-solve operations for proper output display

sasoptpy.interface.SASMediator.solve

`SASMediator.solve(self, **kwargs)`
Solve action for Model objects

sasoptpy.interface.SASMediator.solve_with_mps

`SASMediator.solve_with_mps(self, **kwargs)`
Submits the problem in MPS (DataFrame) format, supported by old versions

Parameters

kwargs [dict] Keyword arguments for solver settings and options

Returns

primal_solution [`pandas.DataFrame`] Solution of the model or None

sasoptpy.interface.SASMediator.solve_with_optmodel

`SASMediator.solve_with_optmodel(self, **kwargs)`
Submits the problem in OPTMODEL format

Parameters

kwargs [dict] Keyword arguments for solver settings and options

Returns

primal_solution [`pandas.DataFrame`] Solution of the model or None

sasoptpy.interface.SASMediator.parse_sas_mps_solution

`SASMediator.parse_sas_mps_solution(self)`
Parses MPS solution after *solve* and returns solution

sasoptpy.interface.SASMediator.parse_sas_solution

`SASMediator.parse_sas_solution(self)`
Performs post-solve operations

Returns

solution [`pandas.DataFrame`] Solution of the problem

sasoptpy.interface.SASMediator.parse_sas_table

`SASMediator.parse_sas_table(self, table_name)`
Converts requested table name into `pandas.DataFrame`

sasoptpy.interface.SASMediator.convert_to_original

`SASMediator.convert_to_original(self, table)`
Converts variable names to their original format if a placeholder gets used

sasoptpy.interface.SASMediator.perform_postsolve_operations

`SASMediator.perform_postsolve_operations(self)`
Performs post-solve operations for proper output display

Workspace

<code>SASMediator.submit(self, **kwargs)</code>	Submit action for custom input and <i>sasoptpy.Workspace</i> objects
<code>SASMediator.submit_optmodel_code(self, ...)</code>	Submits given <i>sasoptpy.Workspace</i> object in OPTMODEL format
<code>SASMediator.parse_sas_workspace_response(self)</code>	Parses results of workspace submission
<code>SASMediator.set_workspace_variable_values(self)</code>	Performs post-solve assignment of <i>sasoptpy.Workspace</i> variable values

sasoptpy.interface.SASMediator.submit

`SASMediator.submit(self, **kwargs)`

Submit action for custom input and *sasoptpy.Workspace* objects

sasoptpy.interface.SASMediator.submit_optmodel_code

`SASMediator.submit_optmodel_code(self, **kwargs)`

Submits given *sasoptpy.Workspace* object in OPTMODEL format

Parameters

kwargs : Solver settings and options

sasoptpy.interface.SASMediator.parse_sas_workspace_response

`SASMediator.parse_sas_workspace_response(self)`

Parses results of workspace submission

sasoptpy.interface.SASMediator.set_workspace_variable_values

`SASMediator.set_workspace_variable_values(self, solution)`

Performs post-solve assignment of *sasoptpy.Workspace* variable values

5.4 Functions

5.4.1 Functions

Utility Functions

<code>dict_to_frame(dictobj[, cols])</code>	Converts dictionaries to DataFrame objects for pretty printing
<code>exp_range(start, stop[, step])</code>	Creates a set within specified range
<code>flatten_frame(df[, swap])</code>	Converts a <code>pandas.DataFrame</code> object into <code>pandas.Series</code>
<code>get_value_table(*args, **kwargs)</code>	Returns values of the given arguments as a merged pandas DataFrame
<code>expr_sum(argv)</code>	Summation function for <i>Expression</i> objects
<code>quick_sum(argv)</code>	Summation function for <i>Expression</i> objects
<code>reset()</code>	Resets package configs and internal counters

sasoptpy.dict_to_frame

dict_to_frame (*dictobj*, *cols=None*)

Converts dictionaries to DataFrame objects for pretty printing

Parameters

dictobj [dict] Dictionary to be converted

cols [list, optional] Column names

Returns

frobj [DataFrame] DataFrame representation of the dictionary

Examples

```
>>> d = {'coal': {'period1': 1, 'period2': 5, 'period3': 7},
>>>       'steel': {'period1': 8, 'period2': 4, 'period3': 3},
>>>       'copper': {'period1': 5, 'period2': 7, 'period3': 9}}
>>> df = so.dict_to_frame(d)
>>> print(df)
   period1  period2  period3
coal         1         5         7
copper        5         7         9
steel         8         4         3
```

sasoptpy.exp_range

exp_range (*start*, *stop*, *step=1*)

Creates a set within specified range

Parameters

start [*Expression*] First value of the range

stop [*Expression*] Last value of the range

step [*Expression*, optional] Step size of the range

Returns

exset [Set] Set that represents the range

Examples

```
>>> N = so.Parameter(name='N')
>>> p = so.exp_range(1, N)
>>> print(p._defn())
set 1..N;
```

sasoptpy.flatten_frame**flatten_frame** (*df*, *swap=False*)Converts a `pandas.DataFrame` object into `pandas.Series`**Parameters****df** [`pandas.DataFrame`] DataFrame to be flattened**swap** [boolean, optional] Option to use columns as first index**Returns****new_frame** [`pandas.DataFrame`] A new DataFrame where indices consist of index and columns names as tuples**Examples**

```
>>> price = pd.DataFrame([
>>>     [1, 5, 7],
>>>     [8, 4, 3],
>>>     [5, 7, 9]], columns=['period1', 'period2', 'period3']).\
>>>     set_index(['coal', 'steel', 'copper'])
>>> print('Price data: \n{}'.format(price))
>>> price_f = so.flatten_frame(price)
>>> print('Price data: \n{}'.format(price_f))
Price data:
      period1  period2  period3
coal         1         5         7
steel        8         4         3
copper        5         7         9
Price data:
(coal, period1)      1
(coal, period2)      5
(coal, period3)      7
(steel, period1)     8
(steel, period2)     4
(steel, period3)     3
(copper, period1)    5
(copper, period2)    7
(copper, period3)    9
dtype: int64
```

sasoptpy.get_value_table**get_value_table** (**args*, ***kwargs*)

Returns values of the given arguments as a merged pandas DataFrame

Parameters**key** [list, optional] Keys for objects**rhs** [bool, optional] Option for including constant values**Returns****table** [`pandas.DataFrame`] DataFrame object that holds object values

sasoptpy.expr_sum

expr_sum (*argv*)

Summation function for *Expression* objects

Returns

exp [*Expression*] Sum of given arguments

Notes

This function is faster for expressions compared to Python's native `sum()` function.

Examples

```
>>> x = so.VariableGroup(10000, name='x')
>>> y = so.expr_sum(2*x[i] for i in range(10000))
```

sasoptpy.quick_sum

quick_sum (*argv*)

Summation function for *Expression* objects

Notes

This method will deprecate in future versions. Use `expr_sum()` instead.

sasoptpy.reset

reset ()

Resets package configs and internal counters

Abstract Actions

<code>actions.read_data</code> (table, index, columns)	Reads data tables inside Set and Parameter objects
<code>actions.create_data</code> (table, index, columns)	Creates data tables from variables, parameters, and expressions
<code>actions.solve</code> ([options, primalin])	Solves the active optimization problem and generates results
<code>actions.for_loop</code> (*args)	Creates a for-loop container to be executed on the server
<code>actions.cofor_loop</code> (*args)	Creates a cofor-loop to be executed on the server concurrently
<code>actions.if_condition</code> (logic_expression, ...)	Creates an if-else block
<code>actions.switch_conditions</code> (**args)	Creates several if-else blocks by using the specified arguments
<code>actions.set_value</code> (left, right)	Creates an assignment statement
<code>actions.fix</code> (*args)	Fixes values of variables to the specified values

Continued on next page

Table 34 – continued from previous page

<code>actions.unfix(*args)</code>	Unfixes values of variables
<code>actions.set_objective(expression, name, sense)</code>	Specifies the objective function
<code>actions.print_item(*args)</code>	Prints the specified argument list on server
<code>actions.put_item(*args[, names])</code>	Prints the specified item values to the output log
<code>actions.expand()</code>	Prints expanded problem to output
<code>actions.drop(*args)</code>	Drops the specified constraints or constraint groups from model
<code>actions.restore(*args)</code>	Restores dropped constraint and constraint groups
<code>actions.union(*args)</code>	Aggregates the specified sets and set expressions
<code>actions.diff(left, right)</code>	Gets the difference between set and set expressions
<code>actions.substring(main_string, first_pos, ...)</code>	Gets the substring of the specified positions
<code>actions.use_problem(problem)</code>	Changes the currently active problem

sasoptpy.actions.read_data

read_data (*table, index, columns*)

Reads data tables inside Set and Parameter objects

Parameters

table [string or `swat.cas.table.CASTable`] Table object or name to be read, case-insensitive

index [dict] Index properties of the table

Has two main members:

- **target** [`sasoptpy.abstract.Set`] Target Set object to be read into
- **key** [string, list or None] Column name to be read from.

For multiple indices, key should be a list of string or `sasoptpy.abstract.SetIterator` objects

For a given set *YEAR* and column name *year_no*, the index dictionary should be written as:

```
>>> {'target': YEAR, 'key': 'year_no'}
```

If index is simply the row number, use *'key': so.N* which is equivalent to the special *_N_* character in the SAS language.

columns [list] A list of dictionaries, each holding column properties.

Columns are printed in the specified order. Each column should be represented as a dictionary with following fields:

- **target** [`sasoptpy.abstract.ParameterGroup`] Target parameter object to be read into
- **column** [string] Column name to be read from
- **index** [`sasoptpy.SetIterator`, optional] Subindex for specific column, needed for complex operations

If the name of the `sasoptpy.abstract.Parameter` object is same as the column name, the following call is enough:

```
>>> p = so.Parameter(name='price')
>>> read_data(..., columns=[{'target': p}])
```

For reading a different column name, *column* field should be specified:

```
>>> {'target': p, 'column': 'price_usd'}
```

When working with `ParameterGroup` objects, sometimes a secondary loop is needed. This is achieved by using the *index* field, along with the `sasoptpy.abstract.statement.ReadDataStatement.append()` method.

Returns

r [`sasoptpy.abstract.statement.ReadDataStatement`] Read data statement object, which includes all properties

Additional columns can be added using the `sasoptpy.abstract.statement.ReadDataStatement.append()` function.

See also:

`tests.abstract.statement.test_read_data.TestReadData`

Examples

Reading a regular set:

```
>>> with Workspace('test_workspace') as ws:
>>>     ITEMS = Set(name='ITEMS')
>>>     value = ParameterGroup(ITEMS, name='value', init=0)
>>>     get = VariableGroup(ITEMS, name='get', vartype=so.INT, lb=0)
>>>     read_data(
...         table="values",
...         index={'target': ITEMS, 'key': None},
...         columns=[{'target': value}])
>>> print(so.to_optmodel(w))
proc optmodel;
    set ITEMS;
    num value {ITEMS} init 0;
    var get {{ITEMS}} integer >= 0;
    read data values into ITEMS value;
quit;
```

Reading with row index:

```
>>> with so.Workspace('test_read_data_n') as ws:
>>>     ASSETS = so.Set(name='ASSETS')
>>>     ret = so.ParameterGroup(ASSETS, name='return', ptype=so.NUM)
>>>     read_data(
...         table='means',
...         index={'target': ASSETS, 'key': so.N},
...         columns=[{'target': ret}]
...     )
>>> print(so.to_optmodel(w))
proc optmodel;
    set ASSETS;
    num return {ASSETS};
```

(continues on next page)

(continued from previous page)

```

    read data means into ASSETS=[_N_] return;
quit;

```

Reading with no index set and subindex:

```

>>> with so.Workspace('test_read_data_no_index_expression') as ws:
>>>     ASSETS = so.Set(name='ASSETS')
>>>     cov = so.ParameterGroup(ASSETS, ASSETS, name='cov', init=0)
>>>     with iterate(ASSETS, 'asset1') as asset1, iterate(ASSETS, 'asset2') as
    ↪asset2:
>>>         read_data(
...             table='covdata',
...             index={'key': [asset1, asset2]},
...             columns=[
...                 {'target': cov},
...                 {'target': cov[asset2, asset1]},
...                 {'column': 'cov'}])
>>> print(so.to_optmodel(w))
proc optmodel;
    set ASSETS;
    num cov {ASSETS, ASSETS} init 0;
    read data covdata into [asset1 asset2] cov cov[asset2, asset1]=cov;
quit;

```

Reading a column with multiple indices:

```

>>> with so.Workspace(name='test_read_data_idx_col') as ws:
>>>     dow = so.Set(name='DOW', value=so.exp_range(1, 6))
>>>     locs = so.Set(name='LOCS', settype=so.STR)
>>>     demand = so.ParameterGroup(locs, dow, name='demand')
>>>     with iterate(locs, name='loc') as loc:
>>>         r = read_data(
...             table='dmnd',
...             index={'target': locs, 'key': loc}
...         )
>>>         with iterate(dow, name='d') as d:
>>>             r.append({
...                 'index': d,
...                 'target': demand[loc, d],
...                 'column': concat('day', d)
...             })
>>> optmodel_code = so.to_optmodel(ws)
proc optmodel;
    set DOW = 1..5;
    set <str> LOCS;
    num demand {LOCS, DOW};
    read data dmnd into LOCS=[loc] {d in DOW} < demand[loc, d]=col('day' || d) >;
quit;

```

sasoptpy.actions.create_data

create_data (*table, index, columns*)

Creates data tables from variables, parameters, and expressions

Parameters

table [string] Name of the table to be created

index [dict] Table index properties

This dictionary can be empty if no index is needed. It can have following fields:

- **key** [list] List of index keys. Keys can be string or `sasoptpy.abstract.SetIterator` objects
- **set** [list] List of sets that is being assigned to keys

columns [list] List of columns. Columns can be `sasoptpy.abstract.Parameter`, `sasoptpy.abstract.ParameterGroup` objects or dictionaries. If specified as a dictionary, each can have following keys:

- **name** [string] Name of the column in output table
- **expression** [`sasoptpy.core.Expression`] Any expression
- **index** [list or `sasoptpy.abstract.SetIterator`] Index for internal loops

The *index* field can be used when a subindex is needed. When specified as a list, members should be `sasoptpy.abstract.SetIterator` objects. See examples for more details.

`tests.abstract.statement.test_create_data.TestCreateData`

Examples

Regular column:

```
>>> with so.Workspace('w') as w:
>>>     m = so.Parameter(name='m', value=7)
>>>     n = so.Parameter(name='n', value=5)
>>>     create_data(table='example', index={}, columns=[m, n])
>>> print(so.to_optmodel(w))
proc optmodel;
    num m = 7;
    num n = 5;
    create data example from m n;
quit;
```

Column with name:

```
>>> with so.Workspace('w') as w:
>>>     m = so.Parameter(name='m', value=7)
>>>     n = so.Parameter(name='n', value=5)
>>>     create_data(table='example', index={}, columns=[
...         {'name': 'ratio', 'expression': m/n}
...     ])
>>> print(so.to_optmodel(w))
```

(continues on next page)

(continued from previous page)

```
proc optmodel;
  num m = 7;
  num n = 5;
  create data example from ratio=((m) / (n));
quit;
```

Column name with concat:

```
>>> from sasoptpy.util import concat
>>> with so.Workspace('w') as w:
>>>     m = so.Parameter(name='m', value=7)
>>>     n = so.Parameter(name='n', value=5)
>>>     create_data(table='example', index={}, columns=[
...         {'name': concat('s', n), 'expression': m+n}
...     ])
>>> print(so.to_optmodel(w))
proc optmodel;
  num m = 7;
  num n = 5;
  create data example from col('s' || n)=(m + n);
quit;
```

Table with index:

```
>>> with so.Workspace('w') as w:
>>>     m = so.ParameterGroup(
>>>         so.exp_range(1, 6), so.exp_range(1, 4), name='m', init=0)
>>>     m[1, 1] = 1
>>>     m[4, 1] = 1
>>>     S = so.Set(name='ISET', value=[i*2 for i in range(1, 3)])
>>>     create_data(
...         table='example',
...         index={'key': ['i', 'j'], 'set': [S, [1, 2]]},
...         columns=[m]
...     )
>>> print(so.to_optmodel(w))
proc optmodel;
  num m {1..5, 1..3} init 0;
  m[1, 1] = 1;
  m[4, 1] = 1;
  set ISET = {1,4};
  create data example from [i j] = {{ISET,{1,2}}} m;
quit;
```

Index over Python range:

```
>>> with so.Workspace('w') as w:
>>>     s = so.Set(name='S', value=so.exp_range(1, 6))
>>>     x = so.VariableGroup(s, name='x')
>>>     x[1] = 1
>>>     create_data(table='example',
...         index={'key': ['i'], 'set': so.exp_range(1, 4)}, columns=[x])
>>> print(so.to_optmodel(w))
proc optmodel;
  set S = 1..5;
  var x {{S}};
  x[1] = 1;
```

(continues on next page)

(continued from previous page)

```

    create data example from [i] = {1..3} x;
quit;

```

Append column with index:

```

>>> from sasoptpy.util import iterate, concat
>>> with so.Workspace('w', session=session) as w:
>>>     alph = so.Set(name='alph', settype=so.string, value=['a', 'b', 'c'])
>>>     x = so.VariableGroup([1, 2, 3], alph, name='x', init=2)
>>>     with iterate(so.exp_range(1, 4), name='i') as i:
>>>         c = create_data(
>>>             table='example',
>>>             index={'key': [i], 'set': [i.get_set()]})
>>>         with iterate(alph, name='j') as j:
>>>             c.append(
>>>                 {'name': concat('x', j),
>>>                  'expression': x[i, j],
>>>                  'index': j})
>>> print(so.to_optmodel(w))
proc optmodel;
    set <str> alph = {'a','b','c'};
    var x {{1,2,3}, {alph}} init 2;
    create data example from [i] = {{1..3}} {j in alph} < col('x' || j)=(x[i, j])_
↪>;
quit;

```

Multiple column indices:

```

>>> from sasoptpy.util import concat, iterate
>>> with so.Workspace('w') as w:
>>>     S = so.Set(name='S', value=[1, 2, 3])
>>>     T = so.Set(name='T', value=[1, 3, 5])
>>>     x = so.VariableGroup(S, T, name='x', init=1)
>>>     with iterate(S, name='i') as i, iterate(T, name='j') as j:
>>>         create_data(
>>>             table='out',
>>>             index={},
>>>             columns=[
>>>                 {'name': concat('x', concat(i, j)), 'expression': x[i, j],
>>>                  'index': [i, j]})
>>> print(so.to_optmodel(w))
proc optmodel;
    set S = {1,2,3};
    set T = {1,3,5};
    var x {{S}, {T}} init 1;
    create data out from {i in S, j in T} < col('x' || i || j)=(x[i, j]) >;
quit;

```

sasoptpy.actions.solve

solve (*options=None, primalin=False*)

Solves the active optimization problem and generates results

Parameters

options [dict, optional] Solver options

This dictionary can have several fields.

- **with** [string] Name of the solver, see possible values under Notes.

See [Solver Options](#) for a list of solver options. All fields in options (except *with*) is passed directly to the solver.

primalin [bool, optional] When set to *True*, uses existing variable values as an initial point in MILP solver

Returns

ss [*sasoptpy.abstract.statement.SolveStatement*] Solve statement object.

Contents of the response can be retrieved using *get_response* function.

Notes

Possible solver names for *with* parameter:

- *lp* : Linear programming
- *milp* : Mixed integer linear programming
- *nlp* : General nonlinear programming
- *qp* : Quadratic programming
- *blackbox* : Black-box optimization

SAS Optimization also has a constraint programming solver (clp), and network solver (network) but they are not currently supported by sasoptpy.

Examples

Regular solve:

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1, ub=10)
>>>     o = so.Objective(2*x, sense=so.maximize, name='obj')
>>>     s = solve()
>>>     p = print_item(x)
>>> print(so.to_optmodel(w))
proc optmodel;
    var x >= 1 <= 10;
    max obj = 2 * x;
    solve;
    print x;
quit;
```

Option alternatives:

```
>>> with so.Workspace('w') as w:
>>>     # Problem declaration, etc..
>>>     solve()
>>>     solve(options={'with': 'milp'})
>>>     solve(options={'with': 'milp'}, primalin=True)
>>>     solve(options={'with': 'milp', 'presolver': None, 'feastol': 1e-6,
>>>                     'logfreq': 2, 'maxsols': 3, 'scale': 'automatic',
>>>                     'restarts': None, 'cutmir': 'aggressive'})
>>> print(so.to_optmodel(w))
proc optmodel;
    solve;
    solve with milp;
    solve with milp / primalin;
    solve with milp / presolver=None feastol=1e-06 logfreq=2 maxsols=3_
↪scale=automatic restarts=None cutmir=aggressive;
quit;
```

sasoptpy.actions.for_loop

for_loop(*args)

Creates a for-loop container to be executed on the server

Parameters

args [*sasoptpy.abstract.Set* objects] Any number of *sasoptpy.abstract.Set* objects can be given

Returns

set_iterator [*sasoptpy.abstract.SetIterator*, *sasoptpy.abstract.SetIteratorGroup*] Set iterators to be used inside for-loop

See also:

sasoptpy.actions.cofor_loop()

Notes

For tasks that can be run concurrently, consider using *sasoptpy.actions.cofor_loop()*

Examples

Regular for loop:

```
>>> with so.Workspace('w') as w:
>>>     r = so.exp_range(1, 11)
>>>     x = so.VariableGroup(r, name='x')
>>>     for i in for_loop(r):
>>>         x[i] = 1
>>> print(so.to_optmodel(w))
proc optmodel;
    var x {{1,2,3,4,5,6,7,8,9,10}};
    for {o13 in 1..10} do;
        x[o13] = 1;
```

(continues on next page)

(continued from previous page)

```

    end;
quit;

```

Nested for loops:

```

>>> from sasoptpy.actions import put_item
>>> with so.Workspace('w') as w:
>>>     for i in for_loop(range(1, 3)):
>>>         for j in for_loop(['a', 'b']):
>>>             put_item(i, j)
>>> print(so.to_optmodel(w))
proc optmodel;
    for {o2 in 1..2} do;
        for {o5 in {'a', 'b'}} do;
            put o2 o5;
        end;
    end;
quit;

```

Multiple set for-loops:

```

>>> with so.Workspace('w') as w:
>>>     r = so.Set(name='R', value=range(1, 11))
>>>     c = so.Set(name='C', value=range(1, 6))
>>>     a = so.ParameterGroup(r, c, name='A', ptype=so.number)
>>>     for (i, j) in for_loop(r, c):
>>>         a[i, j] = 1
>>> print(so.to_optmodel(w))
proc optmodel;
    set R = 1..10;
    set C = 1..5;
    num A {R, C};
    for {o5 in R, o7 in C} do;
        A[o5, o7] = 1;
    end;
quit;

```

sasoptpy.actions.cofor_loop

cofor_loop (*args)

Creates a cofor-loop to be executed on the server concurrently

Parameters

args [*sasoptpy.abstract.Set* objects] Any number of *sasoptpy.abstract.Set* objects can be specified

Returns

set_iterator [*sasoptpy.abstract.SetIterator*, *sasoptpy.abstract.SetIteratorGroup*] Set iterators to be used inside cofor-loop

See also:

sasoptpy.actions.for_loop()

Notes

A cofor-loop runs its content concurrently. For tasks that depend on each other, consider using `sasoptpy.actions.for_loop()`

Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(6, name='x', lb=0)
>>>     so.Objective(
>>>         so.expr_sum(x[i] for i in range(6)), name='z', sense=so.MIN)
>>>     a1 = so.Constraint(x[1] + x[2] + x[3] <= 4, name='a1')
>>>     for i in cofor_loop(so.exp_range(3, 6)):
>>>         fix(x[1], i)
>>>         solve()
>>>         put_item(i, x[1], so.Symbol('_solution_status_'), names=True)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{0,1,2,3,4,5}} >= 0;
  min z = x[0] + x[1] + x[2] + x[3] + x[4] + x[5];
  con a1 : x[1] + x[2] + x[3] <= 4;
  cofor {o13 in 3..5} do;
    fix x[1]=o13;
    solve;
    put o13= x[1]= _solution_status_;
  end;
quit;
```

sasoptpy.actions.if_condition

if_condition (*logic_expression*, *if_statement*, *else_statement=None*)

Creates an if-else block

Parameters

logic_expression [*sasoptpy.Constraint* or *sasoptpy.abstract.Condition*]
Logical condition for the True case

For the condition, it is possible to combine constraints, such as

```
>>> a = so.Parameter(value=5)
>>> if_condition((a < 3) | (a > 6), func1, func2)
```

Constraints should be combined using bitwise operators (& for *and*, | for *or*).

if_statement [function or *IfElseStatement*] Python function or if-else statement to be called if the condition is True

else_statement [function or *IfElseStatement*, optional] Python function or if-else statement to be called if the condition is False

Examples

Regular condition:

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     x.set_value(0.5)
>>>     def func1():
>>>         x.set_value(1)
>>>     def func2():
>>>         x.set_value(0)
>>>     if_condition(x > 1e-6, func1, func2)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x;
  x = 0.5;
  if x > 1e-06 then do;
    x = 1;
  end;
  else do;
    x = 0;
  end;
quit;
```

Combined conditions:

```
>>> with so.Workspace('w') as w:
>>>     p = so.Parameter(name='p')
>>>     def case1():
>>>         p.set_value(10)
>>>     def case2():
>>>         p.set_value(20)
>>>     r = so.Parameter(name='r', value=10)
>>>     if_condition((r < 5) | (r > 10), case1, case2)
>>> print(so.to_optmodel(w))
proc optmodel;
  num p;
  num r = 10;
  if (r < 5) or (r > 10) then do;
    p = 10;
  end;
  else do;
    p = 20;
  end;
quit;
```

sasoptpy.actions.switch_conditions

switch_conditions (**args)

Creates several if-else blocks by using the specified arguments

Parameters

args : Several arguments can be passed to the function

Each case should follow a condition. You can use `sasoptpy.Constraint` objects as conditions, and Python functions for the cases.

Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     p = so.Parameter(name='p')
>>>     x.set_value(2.5)
>>>     def func1():
>>>         p.set_value(1)
>>>     def func2():
>>>         p.set_value(2)
>>>     def func3():
>>>         p.set_value(3)
>>>     def func4():
>>>         p.set_value(0)
>>>     switch_conditions(x < 1, func1, x < 2, func2, x < 3, func3, func4)
>>> print(to.optmodel(w))
proc optmodel;
  var x;
  num p;
  x = 2.5;
  if x < 1 then do;
    p = 1;
  end;
  else if x < 2 then do;
    p = 2;
  end;
  else if x < 3 then do;
    p = 3;
  end;
  else do;
    p = 0;
  end;
quit;
```

sasoptpy.actions.set_value

set_value (*left*, *right*)

Creates an assignment statement

Parameters

left [*sasoptpy.Expression*] Any expression (variable or parameter)

right [*sasoptpy.Expression* or float] Right-hand-side expression

Examples

```
>>> with so.Workspace('ex_9_1_matirx_sqrt', session=None) as w:
>>>     so.LiteralStatement('call streaminit(1);')
>>>     n = so.Parameter(name='n', value=5)
>>>     rn = so.Set(name='RN', value=so.exp_range(1, n))
>>>     A = so.ParameterGroup(rn, rn, name='A', value="10-20*rand('UNIFORM')")
>>>     P = so.ParameterGroup(rn, rn, name='P')
>>>     for i in for_loop(rn):
>>>         for j in for_loop(so.exp_range(i, n)):
```

(continues on next page)

(continued from previous page)

```

>>>         set_value(P[i, j], so.expr_sum(A[i, k] * A[j, k] for k in rn))
>>> print(so.to_optmodel(w))
proc optmodel;
  call streaminit(1);
  num n = 5;
  set RN = 1..n;
  num A {RN, RN} = 10-20*rand('UNIFORM');
  num P {RN, RN};
  for {o7 in RN} do;
    for {o10 in o7..n} do;
      P[o7, o10] = sum {k in RN} (A[o7, k] * A[o10, k]);
    end;
  end;
quit;

```

sasoptpy.actions.fix

fix (*args)

Fixes values of variables to the specified values

Parameters

args [*sasoptpy.Variable*, float, *sasoptpy.Expression*, tuple] Set of arguments to be fixed

Arguments get paired (if not given in tuples) to allow several fix operations

See also:

sasoptpy.actions.unfix()

tests.abstract.statement.test_fix_unfix.TestFix

Examples

Regular fix statement:

```

>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     fix(x, 1)
>>>     solve()
>>>     unfix(x)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x;
  fix x=1;
  solve;
  unfix x;
quit;

```

Multiple fix-unfix:

```

>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(4, name='x')
>>>     for i in cofor_loop(range(4)):

```

(continues on next page)

(continued from previous page)

```

>>>         fix((x[0], i), (x[1], 1))
>>>         solve()
>>>         unfix(x[0], (x[1], 2))
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{0,1,2,3}};
  cofor {o7 in 0..3} do;
    fix x[0]=o7 x[1]=1;
    solve;
    unfix x[0] x[1]=2;
  end;
quit;

```

sasoptpy.actions.unfix

unfix(*args)

Unfixes values of variables

Parameters

args [*sasoptpy.Variable* objects] Set of arguments to be unfixed

See also:

sasoptpy.actions.fix()

tests.abstract.statement.test_fix_unfix.TestFix

Examples

Regular unfix statement:

```

>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     fix(x, 1)
>>>     solve()
>>>     unfix(x)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x;
  fix x=1;
  solve;
  unfix x;
quit;

```

Multiple fix-unfix:

```

>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(4, name='x')
>>>     for i in cofor_loop(range(4)):
>>>         fix((x[0], i), (x[1], 1))
>>>         solve()
>>>         unfix(x[0], (x[1], 2))
>>> print(so.to_optmodel(w))
proc optmodel;

```

(continues on next page)

(continued from previous page)

```

var x {{0,1,2,3}};
cofor {o7 in 0..3} do;
    fix x[0]=o7 x[1]=1;
    solve;
    unfix x[0] x[1]=2;
end;
quit;

```

sasoptpy.actions.set_objective

set_objective (*expression, name, sense*)

Specifies the objective function

Parameters

expression [*sasoptpy.Expression*] Objective function

name [string] Name of the objective function

sense [string] Direction of the objective function, *so.MAX* or *so.MIN*

Examples

```

>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1)
>>>     set_objective(x ** 3, name='xcube', sense=so.minimize)
>>>     solve()
>>> print(so.to_optmodel(w))
proc optmodel;
    var x >= 1;
    MIN xcube = (x) ^ (3);
    solve;
quit;

```

sasoptpy.actions.print_item

print_item (**args*)

Prints the specified argument list on server

Parameters

args [*sasoptpy.Variable, sasoptpy.Expression*] Arbitrary number of arguments to be printed

These values are printed on the server, but can be retrieved after execution

Returns

ps [*sasoptpy.abstract.statement.PrintStatement*] Print statement object.

Contents of the response can be retrieved using *get_response* function.

Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1, ub=10)
>>>     o = so.Objective(2*x, sense=so.maximize, name='obj')
>>>     s = solve()
>>>     p = print_item(x)
>>> print(so.to_optmodel(w))
proc optmodel;
    var x >= 1 <= 10;
    max obj = 2 * x;
    solve;
    print x;
quit;
>>> print(p.get_response())
           x
0  10.0
```

sasoptpy.actions.put_item

put_item (*args, names=None)

Prints the specified item values to the output log

Parameters

args [*sasoptpy.Expression*, string] Arbitrary elements to be put into log

Variables, variable groups, and expressions can be printed to log

names [bool, optional] When set to *True*, prints the name of the arguments in the log

Examples

Regular operation:

```
>>> with so.Workspace('w') as w:
>>>     for i in for_loop(range(1, 3)):
>>>         for j in for_loop(['a', 'b']):
>>>             put_item(i, j)
>>> print(so.to_optmodel(w))
proc optmodel;
    for {o2 in 1..2} do;
        for {o5 in {'a', 'b'}} do;
            put o2 o5;
        end;
    end;
quit;
```

Print with names:

```
>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(6, name='x', lb=0)
>>>     so.Objective(
>>>         so.expr_sum(x[i] for i in range(6)), name='z', sense=so.MIN)
>>>     a1 = so.Constraint(x[1] + x[2] + x[3] <= 4, name='a1')
>>>     for i in cofor_loop(so.exp_range(3, 6)):
```

(continues on next page)

(continued from previous page)

```

>>>         fix(x[1], i)
>>>         solve()
>>>         put_item(i, x[1], so.Symbol('_solution_status_'), names=True)
proc optmodel;
  var x {{0,1,2,3,4,5}} >= 0;
  min z = x[0] + x[1] + x[2] + x[3] + x[4] + x[5];
  con a1 : x[1] + x[2] + x[3] <= 4;
  cofor {o13 in 3..5} do;
    fix x[1]=o13;
    solve;
    put o13= x[1]= _solution_status_;
  end;
quit;

```

sasoptpy.actions.expand

expand()

Prints expanded problem to output

Examples

```

>>> with so.Workspace(name='w') as w:
>>>     x = so.VariableGroup(3, name='x')
>>>     self.assertEqual(x[0].sym.get_conditions_str(), '')
>>>     # solve
>>>     x[0].set_value(1)
>>>     x[1].set_value(5)
>>>     x[2].set_value(0)
>>>     c = so.ConstraintGroup(None, name='c')
>>>     with iterate([0, 1, 2], 's') as i:
>>>         with condition(x[i].sym > 0):
>>>             c[i] = x[i] >= 1
>>>     set_objective(x[0], name='obj', sense=so.MIN)
>>>     expand()
>>>     solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{0,1,2}};
  x[0] = 1;
  x[1] = 5;
  x[2] = 0;
  con c {s in {0,1,2}: x[s].sol > 0} : x[s] >= 1;
  MIN obj = x[0];
  expand;
  solve;
quit;

```

sasoptpy.actions.drop

drop (*args)

Drops the specified constraints or constraint groups from model

Parameters

args [*sasoptpy.Constraint*, *sasoptpy.ConstraintGroup*] Constraints to be dropped

See also:

sasoptpy.actions.restore()

Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1)
>>>     y = so.Variable(name='y', lb=0)
>>>     c = so.Constraint(sm.sqrt(x) >= 5, name='c')
>>>     o = so.Objective(x + y, sense=so.MIN, name='obj')
>>>     s = solve()
>>>     drop(c)
>>>     o2 = so.Objective(x, sense=so.MIN, name='obj2')
>>>     s2 = solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  var x >= 1;
  var y >= 0;
  con c : sqrt(x) >= 5;
  min obj = x + y;
  solve;
  drop c;
  min obj2 = x;
  solve;
quit;
```

sasoptpy.actions.restore

restore (*args)

Restores dropped constraint and constraint groups

Parameters

args [*sasoptpy.Constraint*, *sasoptpy.ConstraintGroup*] Constraints to be restored

See also:

sasoptpy.actions.drop()

Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=-1)
>>>     set_objective(x**3, name='xcube', sense=so.minimize)
>>>     c = so.Constraint(x >= 1, name='xbound')
>>>     solve()
>>>     drop(c)
>>>     solve()
>>>     restore(c)
>>>     solve()
>>> print(so.to_optmodel(w))
proc optmodel;
    var x >= -1;
    MIN xcube = (x) ^ (3);
    con xbound : x >= 1;
    solve;
    drop xbound;
    solve;
    restore xbound;
    solve;
quit;
```

sasoptpy.actions.union

union (*args)

Aggregates the specified sets and set expressions

Parameters

args [*sasoptpy.abstract.Set* and *sasoptpy.abstract.InlineSet*] Objects to be aggregated

Examples

```
>>> from sasoptpy.actions import union, put_item
>>> with so.Workspace('w') as w:
>>>     n = so.Parameter(name='n', value=11)
>>>     S = so.Set(name='S', value=so.exp_range(1, n))
>>>     T = so.Set(name='T', value=so.exp_range(n+1, 20))
>>>     U = so.Set(name='U', value=union(S, T))
>>>     put_item(U, names=True)
>>> print(so.to_optmodel(w))
proc optmodel;
    num n = 11;
    set S = 1..n;
    set T = n+1..20;
    set U = S union T;
    put U;
quit;
```

sasoptpy.actions.diff

diff (*left*, *right*)

Gets the difference between set and set expressions

Parameters

left [*sasoptpy.abstract.Set*] Left operand

right [*sasoptpy.abstract.Set*] Right operand

Examples

```
>>> from sasoptpy.actions import diff, put_item
>>> with so.Workspace('w') as w:
>>>     S = so.Set(name='S', value=so.exp_range(1, 20))
>>>     T = so.Set(name='T', value=so.exp_range(1, 15))
>>>     U = so.Set(name='U', value=diff(S, T))
>>>     put_item(U, names=True)
>>> print(so.to_optmodel(w))
proc optmodel;
  set S = 1..19;
  set T = 1..14;
  set U = S diff T;
  put U;
quit;
```

sasoptpy.actions.substring

substring (*main_string*, *first_pos*, *last_pos*)

Gets the substring of the specified positions

Parameters

main_string [*sasoptpy.abstract.Parameter* or string] Main string

first_pos [integer] First position of the substring, starting from 1

last_pos [integer] Last position of the substring

Examples

```
>>> with so.Workspace('w') as w:
>>>     p = so.Parameter(name='p', value='random_string', ptype=so.STR)
>>>     r = so.Parameter(name='r', value=substring(p, 1, 6), ptype=so.STR)
>>>     put_item(r)
>>> print(so.to_optmodel(w))
proc optmodel;
  str p = 'random_string';
  str r = substr(p, 1, 6);
  put r;
quit;
```

sasoptpy.actions.use_problem**use_problem** (*problem*)

Changes the currently active problem

Parameters**problem** [*sasoptpy.Model*] Model to be activated**Examples**

```

>>> from sasoptpy.actions import use_problem
>>> with so.Workspace('w') as w:
>>>     m = so.Model(name='m')
>>>     m2 = so.Model(name='m2')
>>>     use_problem(m)
>>>     x = so.Variable(name='x')
>>>     use_problem(m2)
>>>     m.solve()
>>>     m2.solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  problem m;
  problem m2;
  use problem m;
  var x;
  use problem m2;
  use problem m;
  solve;
  use problem m2;
  solve;
quit;

```

Math Functions

<i>math.math_func</i> (exp, op, *args)	Function wrapper for math functions
<i>math.abs</i> (exp)	Absolute value function
<i>math.log</i> (exp)	Natural logarithm function
<i>math.log2</i> (exp)	Logarithm function in base 2
<i>math.log10</i> (exp)	Logarithm function in base 10
<i>math.exp</i> (exp)	Exponential function
<i>math.sqrt</i> (exp)	Square root function
<i>math.mod</i> (exp, divisor)	Modulo function
<i>math.int</i> (exp)	Integer value function
<i>math.sign</i> (exp)	Sign value function
<i>math.max</i> (exp, *args)	Largest value function
<i>math.min</i> (exp, *args)	Smallest value function
<i>math.sin</i> (exp)	Sine function
<i>math.cos</i> (exp)	Cosine function
<i>math.tan</i> (exp)	Tangent function

sasoptpy.math.math_func

math_func (*exp*, *op*, **args*)

Function wrapper for math functions

Parameters

exp [Expression] Expression where the math function will be applied

op [string] String representation of the math function

args [float, optional] Additional arguments

sasoptpy.math.abs

abs (*exp*)

Absolute value function

sasoptpy.math.log

log (*exp*)

Natural logarithm function

sasoptpy.math.log2

log2 (*exp*)

Logarithm function in base 2

sasoptpy.math.log10

log10 (*exp*)

Logarithm function in base 10

sasoptpy.math.exp

exp (*exp*)

Exponential function

sasoptpy.math.sqrt

sqrt (*exp*)

Square root function

sasoptpy.math.mod

mod (*exp*, *divisor*)
Modulo function

Parameters

exp [Expression] Dividend
divisor [Expression] Divisor

sasoptpy.math.int

int (*exp*)
Integer value function

sasoptpy.math.sign

sign (*exp*)
Sign value function

sasoptpy.math.max

max (*exp*, **args*)
Largest value function

sasoptpy.math.min

min (*exp*, **args*)
Smallest value function

sasoptpy.math.sin

sin (*exp*)
Sine function

sasoptpy.math.cos

cos (*exp*)
Cosine function

sasoptpy.math.tan

tan (*exp*)
Tangent function

5.5 Tests

5.5.1 Unit Tests

Core

<i>test_expression.</i> <i>TestExpression</i> ([methodName])	Unit tests for <i>sasoptpy.Expression</i> objects
<i>test_objective.TestObjective</i> ([methodName])	Unit tests for <i>sasoptpy.Objective</i> objects
<i>test_model.TestModel</i> ([methodName])	Unit tests for <i>sasoptpy.Model</i> objects
<i>test_variable.TestVariable</i> ([methodName])	Unit tests for <i>sasoptpy.Variable</i> objects
<i>test_variable_group.</i> <i>TestVariableGroup</i> ([...])	Unit tests for <i>sasoptpy.VariableGroup</i> objects
<i>test_constraint.</i> <i>TestConstraint</i> ([methodName])	Unit tests for <i>sasoptpy.Constraint</i> objects
<i>test_constraint_group.</i> <i>TestConstraintGroup</i> ([...])	Unit tests for <i>sasoptpy.ConstraintGroup</i> objects
<i>test_util.TestUtil</i> ([methodName])	Unit tests for core utility functions

tests.core.test_expression.TestExpression

```
class TestExpression (methodName='runTest')
    Bases: unittest.case.TestCase
    Unit tests for sasoptpy.Expression objects
```

tests.core.test_objective.TestObjective

```
class TestObjective (methodName='runTest')
    Bases: unittest.case.TestCase
    Unit tests for sasoptpy.Objective objects
```

tests.core.test_model.TestModel

```
class TestModel (methodName='runTest')
    Bases: unittest.case.TestCase
    Unit tests for sasoptpy.Model objects
```

tests.core.test_variable.TestVariable

class TestVariable (*methodName='runTest'*)
 Bases: `unittest.case.TestCase`
 Unit tests for *sasoptpy.Variable* objects

tests.core.test_variable_group.TestVariableGroup

class TestVariableGroup (*methodName='runTest'*)
 Bases: `unittest.case.TestCase`
 Unit tests for *sasoptpy.VariableGroup* objects

tests.core.test_constraint.TestConstraint

class TestConstraint (*methodName='runTest'*)
 Bases: `unittest.case.TestCase`
 Unit tests for *sasoptpy.Constraint* objects

tests.core.test_constraint_group.TestConstraintGroup

class TestConstraintGroup (*methodName='runTest'*)
 Bases: `unittest.case.TestCase`
 Unit tests for *sasoptpy.ConstraintGroup* objects

tests.core.test_util.TestUtil

class TestUtil (*methodName='runTest'*)
 Bases: `unittest.case.TestCase`
 Unit tests for core utility functions

Abstract

<i>test_math.TestAbstractMath</i> (<i>methodName</i>)	Unit tests for mathematical functions
<i>test_set.TestSet</i> (<i>methodName</i>)	Unit tests for <i>sasoptpy.abstract.Set</i> objects
<i>test_set_iterator.TestSetIterator</i> (<i>methodName</i>)	Unit tests for <i>sasoptpy.abstract.SetIterator</i> objects
<i>test_parameter.TestParameter</i> (<i>methodName</i>)	
<i>test_implicit_variable.TestImplicitVariable</i> (<i>...</i>)	Unit tests for <i>sasoptpy.abstract.ImplicitVar</i> objects
<i>test_condition.TestCondition</i> (<i>methodName</i>)	Unit tests for abstract conditions to be executed on the server
<i>statement.test_assignment.TestAssignment</i> (<i>...</i>)	Unit tests for assignment statements

Continued on next page

Table 37 – continued from previous page

<code>statement.test_cofor_loop.</code> <code>TestCoforLoop([...])</code>	Unit tests for concurrent for (COFOR) statements
<code>statement.test_create_data.</code> <code>TestCreateData([...])</code>	Unit tests for CREATE DATA statements
<code>statement.test_drop_restore.</code> <code>TestDropRestore([...])</code>	Unit tests for DROP and RESTORE statements
<code>statement.test_fix_unfix.</code> <code>TestFix([methodName])</code>	Unit tests for FIX and UNFIX statements
<code>statement.test_for_loop.</code> <code>TestForLoop([methodName])</code>	Unit tests for FOR statements
<code>statement.test_if_else.</code> <code>TestIfElse([methodName])</code>	Unit tests for IF/ELSE and SWITCH statements
<code>statement.test_literal.</code> <code>TestLiteral([methodName])</code>	Unit tests for literal statements
<code>statement.test_read_data.</code> <code>TestReadData([...])</code>	Unit tests for READ DATA statements
<code>statement.test_solve.</code> <code>TestSolve([methodName])</code>	Unit tests for SOLVE statements

tests.abstract.test_math.TestAbstractMath

class **TestAbstractMath** (*methodName='runTest'*)

Bases: `unittest.case.TestCase`

Unit tests for mathematical functions

tests.abstract.test_set.TestSet

class **TestSet** (*methodName='runTest'*)

Bases: `unittest.case.TestCase`

Unit tests for `sasoptpy.abstract.Set` objects

tests.abstract.test_set_iterator.TestSetIterator

class **TestSetIterator** (*methodName='runTest'*)

Bases: `unittest.case.TestCase`

Unit tests for `sasoptpy.abstract.SetIterator` objects

tests.abstract.test_parameter.TestParameter

class **TestParameter** (*methodName='runTest'*)

Bases: `unittest.case.TestCase`

tests.abstract.test_implicit_variable.TestImplicitVariable

```
class TestImplicitVariable (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for sasoptpy.abstract.ImplicitVar objects
```

tests.abstract.test_condition.TestCondition

```
class TestCondition (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for abstract conditions to be executed on the server
```

tests.abstract.statement.test_assignment.TestAssignment

```
class TestAssignment (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for assignment statements
```

tests.abstract.statement.test_cofor_loop.TestCoforLoop

```
class TestCoforLoop (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for concurrent for (COFOR) statements
```

tests.abstract.statement.test_create_data.TestCreateData

```
class TestCreateData (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for CREATE DATA statements
```

tests.abstract.statement.test_drop_restore.TestDropRestore

```
class TestDropRestore (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for DROP and RESTORE statements
```

tests.abstract.statement.test_fix_unfix.TestFix

```
class TestFix (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for FIX and UNFIX statements
```

tests.abstract.statement.test_for_loop.TestForLoop

```
class TestForLoop (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for FOR statements
```

tests.abstract.statement.test_if_else.TestIfElse

```
class TestIfElse (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for IF/ELSE and SWITCH statements
```

tests.abstract.statement.test_literal.TestLiteral

```
class TestLiteral (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for literal statements
```

tests.abstract.statement.test_read_data.TestReadData

```
class TestReadData (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for READ DATA statements
```

tests.abstract.statement.test_solve.TestSolve

```
class TestSolve (methodName='runTest')  
    Bases: unittest.case.TestCase  
    Unit tests for SOLVE statements
```

Interface

<code>test_cas_interface.</code>	Unit tests for the CAS interface
<code>TestCASInterface([methodName])</code>	
<code>test_sas_interface.</code>	Unit tests for the SAS interface
<code>TestSASInterface([methodName])</code>	

tests.interface.test_cas_interface.TestCASInterface

class **TestCASInterface** (*methodName='runTest'*)
Bases: `unittest.case.TestCase`
Unit tests for the CAS interface

tests.interface.test_sas_interface.TestSASInterface

class **TestSASInterface** (*methodName='runTest'*)
Bases: `unittest.case.TestCase`
Unit tests for the SAS interface

Session

<code>test_workspace.TestWorkspace([methodName])</code>	Unit tests for the <i>sasoptpy.Workspace</i> objects
---	--

tests.session.test_workspace.TestWorkspace

class **TestWorkspace** (*methodName='runTest'*)
Bases: `unittest.case.TestCase`
Unit tests for the *sasoptpy.Workspace* objects

VERSION HISTORY

This page outlines changes from each release.

6.1 v0.2.1 (February 26, 2019)

6.1.1 New Features

- Support for evaluating nonlinear expressions is added, see `Expression.get_value()` and `utils._evaluate()`
- Support for multiple objectives is added for LSO solver, see `Model.set_objective()` and *Multiobjective* example
- Support for spaces inside variable indices is added
- Experimental RESTful API is added

6.1.2 Changes

- Dictionaries inside components are replaced with ordered dictionaries to preserve deterministic behavior
- Math operators are added into the keys of linear coefficient dictionaries
- Some iterators are rewritten by using the *yield* keyword for performance
- `key_name` and `col_names` parameters are added into `read_table()`

6.1.3 Bug Fixes

- Fixed: Using a single variable as an objective is producing incorrect input
- Fixed: `Expression.get_value()` fails to evaluate expressions with operators
- Fixed: `Expression.add()` overrides operators in some instances
- Fixed: Expressions with same components but different operators get summed incorrectly
- Fixed: New version of Viya complains about `pandas.DataFrame` column types
- Syntax fixes for **PEP 8** compliance

6.1.4 Notes

- A Jupyter notebook example of the Diet Problem is added
- A new example is added to show usage of experimental RESTful API
- Unit tests are added for development repository
- CI/CD integration is added for the development repository on Gitlab
- Generated models can be checked by using the hash values inside tests.responses

6.2 v0.2.0 (July 30, 2018)

6.2.1 New Features

- Support for the new runOptmodel CAS action is added
- Nonlinear optimization model building support is added for both SAS 9.4 and SAS Viya solvers
- Abstract model building support is added when using SAS Viya solvers
- New object types, `Set`, `SetIterator`, `Parameter`, `ParameterValue`, `ImplicitVar`, `ExpressionDict`, and `Statement` are added for abstract model building
- `Model.to_optmodel()` method is added for exporting model objects into PROC OPTMODEL code as a string
- Wrapper functions `read_table()` and `read_data()` are added to read CASTable and DataFrame objects into the models
- Math function wrappers are added
- `_expr` and `_defn` methods are added to all object types for producing OPTMODEL expression and definitions
- Multiple solutions are now returned when using `solveMilp` action and can be retrieved by using `Model.get_solution()` method
- `Model.get_variable_value()` is added to get solution values of abstract variables

6.2.2 Changes

- Variable and constraint naming schemes are replaced with OPTMODEL equivalent versions
- Variables and constraints now preserve the order in which they are inserted to the problem
- `Model.to_frame()` method is updated to reflect changes to `VariableGroup` and `ConstraintGroup` orderings
- Two solve methods, `solve_on_cas` and `solve_on_viya` are merged into `Model.solve()`
- `Model.solve()` method checks the available CAS actions and uses the runOptmodel action whenever possible
- As part of the merging process, `lp` and `milp` arguments are replaced with `options` argument in `Model.solve()` and `Model.to_optmodel()`
- An optional argument `frame` is added to `Model.solve()` for forcing use of MPS mode and `solveLp-solveMilp` actions
- Minor changes are applied to `__str__` and `__repr__` methods
- Creation indices for objects are being kept by using the return of the `register_name()` function

- Objective constant values are now being passed by using new CAS action arguments when possible
- A linearity check is added for models
- Test folder is added to the repository

6.2.3 Bug Fixes

- Nondeterministic behavior when generating MPS files is fixed.

6.2.4 Notes

- Abstract and nonlinear models can be solved on Viya only if the `runOptmodel` action is available on the CAS server.
- Three new examples are added which demonstrate abstract model building.
- Some minor changes are applied to the existing examples.

6.3 v0.1.2 (April 24, 2018)

6.3.1 New Features

- As an experimental feature, sasoptpy now supports *SASPy* connections
- `Model.solve_local()` method is added for solving optimization problems by using SAS 9.4 installations
- `Model.drop_variable()`, `Model.drop_variables()`, `Model.drop_constraint()`, `Model.drop_constraints()` methods are added
- `Model.get_constraint()` and `Model.get_constraints()` methods are added to retrieve *Constraint* objects in a model
- `Model.get_variables()` method is added
- `_dual` attribute is added to the *Expression* objects
- `Variable.get_dual()` and `Constraint.get_dual()` methods are added
- `Expression.set_name()` method is added

6.3.2 Changes

- Session argument accepts `saspy.SASsession` objects
- `VariableGroup.muilt()` method now supports `pandas.DataFrame`
- Type check for the `Model.set_session()` is removed to support new session types
- Problem and solution summaries are not being printed by default anymore, see `Model.get_problem_summary()` and `Model.get_solution_summary()`
- The default behavior of dropping the table after each solve is changed, but can be controlled with the `drop` argument of the `Model.solve()` method

6.3.3 Bug Fixes

- Fixed: Variables do not appear in MPS files if they are not used in the model
- Fixed: `Model.solve()` primalin argument does not pass into options

6.3.4 Notes

- A `.gitignore` file is added to the repository.
- A new example is added: Decentralization. Both `CAS` and `SAS` versions of the new example are added.
- There is a known issue with the nondeterministic behavior when creating MPS tables. This will be fixed with a hotfix after the release.
- A new option (no-ex) is added to makedocs script for skipping examples when building docs.

6.4 v0.1.1 (February 26, 2018)

6.4.1 New Features

- Initial value argument 'init' is added for `Variable` objects
- `Variable.set_init()` method is added for variables
- Initial value option 'primalin' is added to `Model.solve()` method
- Table name argument 'name', table drop option 'drop', and replace option 'replace' are added to `Model.solve()` method
- Decomposition block implementation is rewritten; block numbers does not need to be consecutive and ordered `Model.upload_user_blocks()`
- `VariableGroup.get_name()` and `ConstraintGroup.get_name()` methods are added
- `Model.test_session()` method is added for checking if session is defined for models
- `expr_sum()` function is added for faster summation of `Expression` objects

6.4.2 Changes

- `methods.py` is renamed to `utils.py`

6.4.3 Bug Fixes

- Fixed: Crash in VG and CG when a key not in the list is called
- Fixed: `get_value` of pandas is deprecated
- Fixed: Variables can be set as temporary expressions
- Fixed: Ordering in `get_solution_table()` is incorrect for multiple entries

6.5 v0.1.0 (December 22, 2017)

- Initial release
