## PDF Version

**Date:** Feb 19, 2020 **Version:** 1.0.0-alpha

**Links:** [Repository](#) | [Issues](#) | [Releases](#) | [Community](#)

*sasoptpy* is a Python package that provides a modeling interface for [SAS Viya](#) and SAS/OR optimization solvers. It provides a quick way for users to deploy optimization models and solve them by using the [SAS Viya Optimization Action Set](#).

*sasoptpy* can handle linear, mixed integer linear, nonlinear, and black-box optimization problems. You can use native Python structures like dictionaries, tuples, and lists to define an optimization problem. *sasoptpy* supports [Pandas](#) objects extensively.

Under the hood, *sasoptpy* uses the [swat package](#) to communicate with SAS Viya, and uses the [saspy package](#) to communicate with SAS 9.4 installations.

*sasoptpy* is an interface to SAS Optimization solvers. Check [SAS/OR](#) and [PROC OPTMODEL](#) for more details about optimization tools provided by SAS and an interface to model optimization problems inside SAS.

See the SAS Global Forum paper: [Optimization Modeling with Python and SAS Viya](#)

## OVERVIEW

### 1.1 About sasoptpy

**sasoptpy** is a Python package that provides easy and integrated ways of working with SAS Optimization and SAS/OR optimization solvers. It enables developers to model optimization problems with ease by providing high-level building blocks.

#### 1.1.1 Capabilities

sasoptpy is very flexible in terms of optimization problem types it supports and workflow alternatives.

##### Solvers

It currently supports the following model types:

- Linear problems
- Integer linear problems / Mixed integer linear problems
- Quadratic problems
- Nonlinear / Black-box problems

##### Data

It supports working with both client-side data and server-side data. When data are available on the client-side, it populates the model with integrated data and brings the solution back to the client. When data are available on the server-side, it generates the code to be able to populate the model on the server. You can retrieve the final solution after the solve.

##### Platforms

sasoptpy can be used with SAS Viya 3.3 or later and SAS 9.4, in all the supporting operating systems.

## 1.1.2 Road map

sasoptpy has the broader goal of supporting all the functionality of the SAS Optimization and SAS/OR solvers, and providing a high-level set of tools for easily working with models.

## 1.1.3 Versioning

sasoptpy follows [Semantic Versioning](#) as of version 1.0.0.

- Any backwards incompatible changes increase the major version number (X.y.z).
- Minor changes and improvements increase the the minor version number (x.Y.z).
- Patches increase the patch version number (x.y.Z).
- Pre-releases are marked by using *alpha* and *beta*, and release candidates are marked using *rc* identifiers.

## 1.1.4 License

sasoptpy is an open-source package and uses the standard [Apache 2.0 license](#).

## 1.1.5 Support

Have any questions?

- If you have a package-related issue, feel free to report it on [GitHub](#).
- If you have an optimization-related question, consider asking it on [SAS Communities](#).
- For further technical support, reach [SAS Technical Support](#).

## 1.1.6 Contribution

Contributions are always welcome. Clone the project to your working environment and submit pull requests as you see fit. For more details, see the guidelines at the [GitHub repository](#).

## 1.1.7 Highlighted Works

A list of highlighted projects and blog posts:

- [Fastest, cheapest, greenest: How will football fans choose which matches to attend?](#)
- [1 tournament, 12 countries: A logistical maze?](#)
- [Using SAS Optimization with Python and containers](#)
- [Bringing Analytics to the Soccer Transfer Season](#)
- [Visiting all 30 Major League Baseball Stadiums - with Python and SAS Viya](#)

## 1.2 What's New

### 1.2.1 v1.0.0-alpha (TBD)

#### New Features

- Added workspaces; see more info in *User Guide* and *example*
- Added *configurations*
- Added *abstract actions* that allow server-side operations. Highlights include:
  - `actions.read_data()` and `actions.create_data()`
  - `actions.for_loop()` and `actions.cofor_loop()`
  - `actions.print_item()`
  - `actions.solve()`
- Added structure decorators for better control of submissions

#### Changes

- Refactored the entire package. sasoptpy now has *core*, *abstract*, *interface*, *session*, and *util* directories
- Experimental RESTful API was dropped
- `get_obj_by_name` function was removed
- *Iso* solver was renamed to *blackbox*
- Because of the use of literal strings (**PEP 498**), only Python 3.6 or later versions are supported

#### Bug Fixes

- Fixed: Arithmetic operations with powers are generating incorrect results
- Fixed: Variable groups with space in their index are not getting values
- Fixed: Constraints without directions do not produce an error
- Fixed: Documentation does not mention conda-forge library requirement
- Fixed: Single-dimensional parameters are hard to access

## 1.3 License

Apache License  
Version 2.0, January 2004  
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction,

(continues on next page)

(continued from previous page)

and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of

(continues on next page)

(continued from previous page)

this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
  - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
  - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
  - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
  - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and

(continues on next page)

(continued from previous page)

may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

## INSTALLATION

### 2.1 Python version support and dependencies

*sasoptpy* is developed and tested for Python version 3.6+.

It requires the following packages:

- numpy
- saspy
- swat
- pandas

### 2.2 Getting *sasoptpy*

You can install *sasoptpy* by using *pip* or *conda*:

```
pip install sasoptpy  
conda install -c sas-institute sasoptpy
```

Any dependencies should be installed automatically.

Depending on your installation, you might need to add *conda-forge* channel to *conda* by using:

```
conda config --append channels conda-forge
```

#### 2.2.1 GitHub repository

You can also get stable and development versions of *sasoptpy* from the GitHub repository. To get the latest version, call:

```
git clone https://github.com/sassoftware/sasoptpy.git
```

Then inside the *sasoptpy* folder, call:

```
pip install .
```

Alternatively, you can use:

```
python setup.py install
```

## 3.1 Introduction to Optimization

Optimization is an umbrella term for maximizing or minimizing a given target, which can be represented as a function. It is often used in real-life problems from finance to aviation, from chemistry to sports analytics.

Optimization problems can describe a business problem or a physical concept. Any phenomena that can be represented as a function can be optimized by several algorithms. It lies at the heart of several tools we use every day, from routing to Machine Learning.

### 3.1.1 Steps of Optimization

Optimization problems often consists of the following steps<sup>12</sup>:

1. Observe the system and define the problem
2. Gather relevant data
3. Develop a formulation
4. Solve the model
5. Interpret the solution

Often, a process is observed by the modeler to identify the problems. Several examples are finding the shortest path between two locations, maximizing a profit, and maximizing the accuracy of a handwriting recognition algorithm.

Collecting data is often the most daunting process. In the age of big data, it is often difficult to distinguish noise from relevant data. After data are gathered, you can write a formulation. A proper formulation is critical because features such as linearity and convexity greatly impact the performance of solution algorithms, especially for large problems.

Solving a model requires an optimization algorithm. SAS Optimization provides several optimization algorithms to solve a variety of different formulations. See *types of optimization* for more information on this topic.

Finally, the modeler should decide whether the result of an optimization process is valid. If not, the process should be repeated by adding the missing pieces until a satisfactory result is obtained.

---

<sup>2</sup> SAS Institute. SAS/OR 15.1 User's Guide: Mathematical Programming Examples. SAS institute, 2018.

### 3.1.2 Basic Elements

There might be several elements in the definition of an optimization formulation. To clarify these elements, consider an optimization problem of finding a route from your home to the airport.

1. **Variables:** Variables are parameters that the optimization algorithm tunes. In the example, the decisions of which roads to be used are decision variables. An optimization algorithm determines optimal values for variables in the problem.
2. **Objective:** An objective is the measure of performance that is to be maximized or minimized. An objective is a function of variables in a problem, meaning an objective value is obtained for given values of variables in an optimization problem. In the example, the objective function is the time to reach the airport. The optimization algorithm should decide which roads to use in order to minimize the travel time.
3. **Constraints:** Constraints are restrictions on variables that prevent illogical solutions. In the example, the amount of fuel in the car places a restriction on how far you can drive. You can force optimization algorithm to find a solution under a certain mileage, even if there are other solutions which could be shorter in terms of travel time.

In short, *optimization* is choosing **variable** values to maximize or minimize an **objective** function subject to certain **constraints**.

### 3.1.3 Simple Problem

Let us consider a simple example. The following problem (Brewer's Dilemma) is a simplified Resource Allocation problem, presented by Robert G. Bland<sup>3</sup>.

In the problem, a brewer has limited corn, hops, and barley malt inventory. The brewer wants to produce Ale and Beer that will maximize the total profit. Each product requires a certain amount of these three ingredients, as follows:

(per barrel)	Amount Required			
Product	Corn	Hops	Barley Malt	Profit
Ale	5 pounds	4 ounces	35 pounds	\$13
Beer	15 pounds	4 ounces	20 pounds	\$23
(Total Available)	480 pounds	160 ounces	1,190 pounds	

The **variables** in this problem are to decide how many barrels of ale and beer to produce. Let us call them *ale* and *beer*. It might be intuitive to prefer beer to ale due to its higher profit rate. However, doing so might deplete all the resources faster and might leave you with excess amount of hops and barley malt.

The **objective** in this problem is to maximize the total profit function, which is  $13 \cdot \text{ale} + 23 \cdot \text{beer}$ .

Each limitation on ingredients is a **constraint**. For corn, hops, and barley malt, the following constraints apply:

$$5 \cdot \text{ale} + 15 \cdot \text{beer} \leq 480$$

$$4 \cdot \text{ale} + 4 \cdot \text{beer} \leq 160$$

$$35 \cdot \text{ale} + 20 \cdot \text{beer} \leq 1,190$$

Combining all items, the optimization formulation is written as follows:

$$\begin{array}{ll}
 \text{maximize:} & 13 \cdot \text{ale} + 23 \cdot \text{beer} \\
 \text{subject to:} & \\
 & 5 \cdot \text{ale} + 15 \cdot \text{beer} \leq 480 \\
 & 4 \cdot \text{ale} + 4 \cdot \text{beer} \leq 160 \\
 & 35 \cdot \text{ale} + 20 \cdot \text{beer} \leq 1,190 \\
 & \text{ale} \geq 0 \\
 & \text{beer} \geq 0
 \end{array}$$

<sup>3</sup> Bland, Robert G. "The Allocation of Resources by Linear Programming." Scientific American 244 (1981): 126-144.

This problem is small enough to be solved by hand, but let us consider some alternatives.

#	Barrels produced		Profit
	Ale	Beer	
1	34	0	\$442
2	0	32	\$736
3	15	25	\$770
4	12	28	\$800

Producing only ale or beer is inferior to producing a combination of the two, for obvious reasons. Finding the exact ratio that will maximize the profit might be tricky, as seen in solutions 3 and 4. Indeed, solution 4 gives the optimal values that maximize the profit in this example.

Some additional examples of problems that can be formulated as optimization problems are as follows:

- Scheduling project steps to minimize total completion, where tasks might depend on completion of earlier tasks
- Choosing distribution centers for retailers to minimize total cost while satisfying customer demands on time
- Assigning soccer players to a squad to maximize the total rating of the team under foreign player rules
- Finding the cheapest travel option and shortest route between two cities
- Blending chemical products to minimize the total cost while achieving a certain efficiency of detergents
- Choosing a price that will maximize the total profit in a competitive market

See the related section of SAS Optimization 8.5 Mathematical Optimization Procedures<sup>4</sup> for more information about optimization problems and examples.

### 3.1.4 Types of Optimization

The structure of a formulation affects which algorithms can be deployed to solve a problem. The most common optimization types are as follows:

- **Linear optimization:** If the objective function and all constraints of a problem can be described by linear mathematical relations, and if all decision variables are continuous, the formulation is called a Linear problem (LP). LPs are one of the easiest problems in terms of solution time and well-studied in literature.
- **Mixed integer linear optimization:** If a linear formulation involves binary (on/off type decisions) or integer variables, that problem is an Integer Linear Problem (ILP) or Mixed Integer Linear Problem (MILP) depending on variables. MILPs are very popular as many real-life problems can be represented as MILPs.
- **Nonlinear optimization:** If a problem involves nonlinear objectives or constraints (such as exponential, polynomial, absolute values) the problem is called a nonlinear problem (NLP).

<sup>4</sup> [https://go.documentation.sas.com/?cdcId=pgmsascdc&cdcVersion=9.4\\_3.5&docsetId=casmopt&docsetTarget=casmopt\\_intro\\_toc.htm&locale=en](https://go.documentation.sas.com/?cdcId=pgmsascdc&cdcVersion=9.4_3.5&docsetId=casmopt&docsetTarget=casmopt_intro_toc.htm&locale=en)

## 3.2 Basic Functionality

Solving an optimization problem via *sasoptpy* starts with having a running CAS (SAS Viya) Server or having a SAS 9.4 installation. It is possible to model a problem without a connection but solving a problem requires access to SAS Optimization or SAS/OR solvers at runtime.

### 3.2.1 Creating a session

#### Creating a SAS Viya session

*sasoptpy* uses the CAS connection provided by the *swat* package. After installation simply use:

```
In [1]: from swat import CAS
In [2]: s = CAS(hostname, port, userid, password)
```

The last two parameters are optional for some use cases. See [swat Documentation](#) for more details.

#### Creating a SAS 9.4 session

To create a SAS 9.4 session, see [saspy Documentation](#). After customizing the configurations for your setup, you can create a session as follows:

```
import saspy
s = saspy.SASsession(cfgname='winlocal')
```

### 3.2.2 Initializing a model

After creating an active CAS or SAS session, you can create an empty model as follows:

```
In [3]: import sasoptpy as so
In [4]: m = so.Model(name='my_first_model', session=s)
NOTE: Initialized model my_first_model.
```

This command creates an empty model.

### 3.2.3 Processing input data

The easiest way to work with *sasoptpy* is to define problem inputs as Pandas DataFrames. You can define objective and cost coefficients, and lower and upper bounds by using the DataFrame and Series objects. See [Pandas Documentation](#) to learn more.

```
In [5]: import pandas as pd
In [6]: prob_data = pd.DataFrame([
...:     ['Period1', 30, 5],
...:     ['Period2', 15, 5],
...:     ['Period3', 25, 0]
...: ], columns=['period', 'demand', 'min_prod']).set_index(['period'])
...:
```

(continues on next page)

(continued from previous page)

```
In [7]: price_per_product = 10
In [8]: capacity_cost = 10
```

You can extract the set `PERIODS` and the other fields `demand` and `min_production` as follows:

```
In [9]: PERIODS = prob_data.index.tolist()
In [10]: demand = prob_data['demand']
In [11]: min_production = prob_data['min_prod']
```

### 3.2.4 Adding variables

You can add a single variable or a set of variables to *Model* objects.

- *Model.add\_variable()* method is used to add a single variable.

```
In [12]: production_cap = m.add_variable(vartype=so.INT, name='production_cap',
↳ lb=0)
```

When working with multiple models, you can create a variable independent of the model, such as

```
>>> production_cap = so.Variable(name='production_cap', vartype=so.INT, lb=0)
```

and add it to an existing model by using

```
>>> m.include(production_cap)
```

- The *Model.add\_variables()* method is used to add a set of variables.

```
In [13]: production = m.add_variables(PERIODS, vartype=so.INT, name='production',
.....:                               lb=min_production)
.....:
```

When passed as a set of variables, you can retrieve individual variables by using individual keys, such as `production['Period1']`. To create multidimensional variables, simply list all the keys as follows:

```
>>> multivar = m.add_variables(KEYS1, KEYS2, KEYS3, name='multivar')
```

### 3.2.5 Creating expressions

*Expression* objects hold mathematical expressions. Although these objects are mostly used under the hood when defining a model, it is possible to define a custom *Expression* to use later.

```
In [14]: totalRevenue = production.sum('*')*price_per_product
In [15]: totalCost = production_cap * capacity_cost
```

Note the use of the *VariableGroup.sum()* method over a variable group. This method returns the sum of variables inside the group as an *Expression* object. Its multiplication with a scalar `price_per_product` gives the final expression.

Similarly, `totalCost` is simply multiplication of a *Variable* object with a scalar.

### 3.2.6 Setting an objective function

You can define objective functions in terms of expressions. In this problem, the objective is to maximize the profit, so the `Model.set_objective()` method is used as follows:

```
In [16]: m.set_objective(totalRevenue-totalCost, sense=so.MAX, name='totalProfit')
Out[16]: sasoptpy.Expression(exp = 10 * production[Period1] + 10 *
↳ production[Period2] + 10 * production[Period3] - 10 * production_cap, name=
↳ 'totalProfit')
```

Notice that you can define the same objective by using:

```
>>> m.set_objective(production.sum('*')*price_per_product - production_cap*capacity_
↳ cost, sense=so.MAX, name='totalProfit')
```

The mandatory argument `sense` should be assigned the value of either `so.MIN` or `so.MAX` for minimization or maximization problems, respectively.

### 3.2.7 Adding constraints

In *sasoptpy*, constraints are simply expressions with a direction. It is possible to define an expression and add it to a model by defining which direction the linear relation should have.

There are two methods to add constraints. The first one is `Model.add_constraint()` where a single constraint can be added to a model.

The second one is `Model.add_constraints()` where multiple constraints can be added to a model.

```
In [17]: m.add_constraints((production[i] <= production_cap for i in PERIODS),
.....:                    name='capacity')
.....:
Out[17]: sasoptpy.ConstraintGroup([production[Period1] - production_cap <= 0,
↳ production[Period2] - production_cap <= 0, production[Period3] - production_cap <=
↳ 0], name='capacity')
```

```
In [18]: m.add_constraints((production[i] <= demand[i] for i in PERIODS),
.....:                    name='demand')
.....:
Out[18]: sasoptpy.ConstraintGroup([production[Period1] <= 30, production[Period2] <=
↳ 15, production[Period3] <= 25], name='demand')
```

Here, the first term provides a Python generator, which then gets translated into constraints in the problem. The symbols `<=`, `>=`, and `==` are used for less than or equal to, greater than or equal to, and equal to constraints, respectively. You can define range constraints by using `==` symbol and a list of two values that represent lower and upper bounds.

```
In [19]: m.add_constraint(production['Period1'] == [10, 100], name='production_bounds
↳ ')
Out[19]: sasoptpy.Constraint(production[Period1] == [10, 100], name='production_
↳ bounds')
```

### 3.2.8 Solving a problem

After a problem is defined, you can send it to the CAS server or SAS session by calling the `Model.solve()` method. The `Model.solve()` method returns the primal solution when available, and `None` otherwise.

```
In [20]: m.solve()
NOTE: Added action set 'optimization'.
NOTE: Converting model my_first_model to OPTMODEL.
NOTE: Submitting OPTMODEL code to CAS server.
NOTE: Problem generation will use 8 threads.
NOTE: The problem has 4 variables (0 free, 0 fixed).
NOTE: The problem has 0 binary and 4 integer variables.
NOTE: The problem has 7 linear constraints (6 LE, 0 EQ, 0 GE, 1 range).
NOTE: The problem has 10 linear constraint coefficients.
NOTE: The problem has 0 nonlinear constraints (0 LE, 0 EQ, 0 GE, 0 range).
NOTE: The OPTMODEL presolver is disabled for linear problems.
NOTE: The initial MILP heuristics are applied.
NOTE: The MILP presolver value AUTOMATIC is applied.
NOTE: The MILP presolver removed all variables and constraints.
NOTE: Optimal.
NOTE: Objective = 400.
NOTE: The output table 'SOLUTION' in caslib 'CASUSER(casuser)' has 4 rows and 6
↳columns.
NOTE: The output table 'DUAL' in caslib 'CASUSER(casuser)' has 7 rows and 4 columns.
NOTE: The CAS table 'solutionSummary' in caslib 'CASUSER(casuser)' has 18 rows and 4
↳columns.
NOTE: The CAS table 'problemSummary' in caslib 'CASUSER(casuser)' has 20 rows and 4
↳columns.
Out [20]:
Selected Rows from Table SOLUTION
```

	i	var	value	lb	ub	rc
0	1.0	production_cap	25.0	-0.0	1.797693e+308	NaN
1	2.0	production[Period1]	25.0	5.0	1.797693e+308	NaN
2	3.0	production[Period2]	15.0	5.0	1.797693e+308	NaN
3	4.0	production[Period3]	25.0	-0.0	1.797693e+308	NaN

At the end of the solve operation, the solver returns both Problem Summary and Solution Summary tables. These tables can later be accessed by using `m.get_problem_summary()` and `m.get_solution_summary()`.

```
In [21]: print(m.get_solution_summary())
Selected Rows from Table SOLUTIONSUMMARY
```

	Value
Label	
Solver	MILP

Integer Infeasibility	0
Best Bound	400

(continues on next page)

(continued from previous page)

Nodes	0
Solutions Found	3
Iterations	0
Presolve Time	0.01
Solution Time	0.02

### 3.2.9 Printing solutions

You can retrieve the solutions by using the `sasoptpy.get_solution_table()` method. It is strongly suggested to group variables and expressions that share the same keys in a call.

```
In [22]: print(so.get_solution_table(demand, production))
          demand  production
period
Period1      30         25.0
Period2      15         15.0
Period3      25         25.0
```

As seen, a Pandas Series and a Variable object that have the same index keys are printed in this example.

### 3.2.10 Initializing a workspace

If you would like to use extensive abstract modeling capabilities of *sasoptpy*, you can create a workspace. Workspaces support features like server-side for loops, cofor loops (parallel), read data, and create data. You can initialize a `sasoptpy.Workspace` by using Python's *with* keyword. As an example, you can create a workspace with a set and a variable group as follows:

```
In [23]: def create_workspace():
....:     with so.Workspace(name='my_workspace', session=s) as w:
....:         I = so.Set(name='I', value=range(1, 11))
....:         x = so.VariableGroup(I, name='x', lb=0)
....:         return w
....:
```

```
In [24]: workspace = create_workspace()
```

```
In [25]: print(so.to_optmodel(workspace))
proc optmodel;
    set I = 1..10;
    var x {{I}} >= 0;
quit;
```

You can submit a workspace to a CAS server and retrieve the response by using:

```
In [26]: workspace.submit()
NOTE: Added action set 'optimization'.
NOTE: The output table 'SOLUTION' in caslib 'CASUSER(casuser)' has 10 rows and 6_
↳columns.
NOTE: The output table 'DUAL' in caslib 'CASUSER(casuser)' has 0 rows and 4 columns.
Out[26]:
Selected Rows from Table SOLUTION

          i    var  value    lb          ub    rc
```

(continues on next page)

(continued from previous page)

```

0  1.0  x[1]    0.0  0.0  1.797693e+308 NaN
1  2.0  x[2]    0.0  0.0  1.797693e+308 NaN
2  3.0  x[3]    0.0  0.0  1.797693e+308 NaN
3  4.0  x[4]    0.0  0.0  1.797693e+308 NaN
4  5.0  x[5]    0.0  0.0  1.797693e+308 NaN
5  6.0  x[6]    0.0  0.0  1.797693e+308 NaN
6  7.0  x[7]    0.0  0.0  1.797693e+308 NaN
7  8.0  x[8]    0.0  0.0  1.797693e+308 NaN
8  9.0  x[9]    0.0  0.0  1.797693e+308 NaN
9 10.0  x[10]   0.0  0.0  1.797693e+308 NaN

```

### 3.2.11 Package configurations

You can change the default options regarding problem representation as follows:

```
In [27]: x = so.Variable(name='x')
```

```
In [28]: c = so.Constraint(10 / 3 * x + 1e-20 * x ** 2 <= 30 + 1e-11, name='c')
```

```
In [29]: print(so.to_definition(c))
con c : 3.333333333333 * x + 0.0 * ((x) ^ (2)) <= 30.000000000001;
```

```
In [30]: so.config['max_digits'] = 2
```

```
In [31]: print(so.to_definition(c))
con c : 3.33 * x + 0.0 * ((x) ^ (2)) <= 30.0;
```

```
In [32]: so.config['max_digits'] = None
```

```
In [33]: print(so.to_definition(c))
con c : 3.3333333333333335 * x + 1e-20 * ((x) ^ (2)) <= 30.000000000001;
```

You can reset the options as follows:

```
In [34]: del so.config['max_digits']
```

You can also create a new configuration to be used globally:

```
In [35]: so.config['myvalue'] = 2
```

All default configuration options are as follows:

- verbosity (default 3)
- max\_digits (default 12)
- print\_digits (default 6)
- default\_sense (default so.minimization)
- default\_bounds
- valid\_outcomes

## 3.3 Sessions

### 3.3.1 CAS Sessions

A `swat.cas.connection.CAS` session is needed to solve optimization problems with *sasoptpy* by using SAS Viya optimization solvers. See the SAS documentation to learn more about CAS sessions and SAS Viya.

You can create a sample CAS Session as follows:

```
>>> import sasoptpy as so
>>> from swat import CAS
>>> s = CAS(hostname=cas_host, username=cas_username, password=cas_password, port=cas_
↳port)
>>> m = so.Model(name='demo', session=s)
>>> print(repr(m))
sasoptpy.Model(name='demo', session=CAS(hostname, port, username, protocol='cas',
↳name='py-session-1', session=session-no))
```

You can end the session and close the connection as follows:

```
>>> s.terminate()
```

### 3.3.2 SAS Sessions

A `saspy.SASsession` session is needed to solve optimization problems with *sasoptpy* by using SAS/OR solvers on SAS 9.4 clients.

You can create a sample SAS session as follows:

```
>>> import sasoptpy as so
>>> import saspy
>>> sas_session = saspy.SASsession(cfgname='winlocal')
>>> m = so.Model(name='demo', session=sas_session)
>>> print(repr(m))
sasoptpy.Model(name='demo', session=saspy.SASsession(cfgname='winlocal'))
```

It is possible to connect to a SAS session by using a configuration file

```
In [1]: sas = saspy.SASsession(cfgfile=config_file)
Using SAS Config named: sshsas
SAS Connection established. Subprocess id is 8722
```

```
In [2]: m = so.Model(name='demo', session=sas)
NOTE: Initialized model demo.
```

```
In [3]: print(m.get_session().sasver)
9.04.01M6P11072018
```

You can terminate the SAS session as follows:

```
In [4]: sas.endsas()
SAS Connection terminated. Subprocess id was 8722
```

## 3.4 Models

### 3.4.1 Creating a model

You can create an empty model by using the *Model* constructor:

```
In [1]: import sasoptpy as so

In [2]: m = so.Model(name='modell')
NOTE: Initialized model modell.
```

### 3.4.2 Adding new components to a model

Adding a variable:

```
In [3]: x = m.add_variable(name='x', vartype=so.BIN)

In [4]: print(m)
Model: [
  Name: modell
  Objective: MIN [0]
  Variables (1): [
    x
  ]
  Constraints (0): [
  ]
]

In [5]: y = m.add_variable(name='y', lb=1, ub=10)

In [6]: print(m)
Model: [
  Name: modell
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (0): [
  ]
]
```

Adding a constraint:

```
In [7]: c1 = m.add_constraint(x + 2 * y <= 10, name='c1')

In [8]: print(m)
Model: [
  Name: modell
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
```

(continues on next page)

(continued from previous page)

```
    x + 2 * y <= 10
]
]
```

### 3.4.3 Adding existing components to a model

A new model can use existing variables. The typical way to include a variable is to use the `Model.include()` method:

```
In [9]: new_model = so.Model(name='new_model')
NOTE: Initialized model new_model.

In [10]: new_model.include(x, y)

In [11]: print(new_model)
Model: [
  Name: new_model
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (0): [
  ]
]

In [12]: new_model.include(c1)

In [13]: print(new_model)
Model: [
  Name: new_model
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]

In [14]: z = so.Variable(name='z', vartype=so.INT, lb=3)

In [15]: new_model.include(z)

In [16]: print(new_model)
Model: [
  Name: new_model
  Objective: MIN [0]
  Variables (3): [
    x
    y
    z
  ]
  Constraints (1): [
```

(continues on next page)

(continued from previous page)

```

    x + 2 * y <= 10
]
]

```

Note that variables are added to *Model* objects by reference. Therefore, after *Model.solve()* is called, the values of variables are replaced with optimal values.

### 3.4.4 Accessing components

You can get a list of model variables by using the *Model.get\_variables()* method:

```

In [17]: print(m.get_variables())
[sasoptpy.Variable(name='x', lb=0, ub=1, vartype='BIN'), sasoptpy.Variable(name='y',
↳ lb=1, ub=10, vartype='CONT')]

```

Similarly, you can access a list of constraints by using the *Model.get\_constraints()* method:

```

In [18]: c2 = m.add_constraint(2 * x - y >= 1, name='c2')

In [19]: print(m.get_constraints())
[sasoptpy.Constraint(x + 2 * y <= 10, name='c1'), sasoptpy.Constraint(2 * x - y >=
↳ 1, name='c2')]

```

To access a certain constraint by using its name, you can use the *Model.get\_constraint()* method:

```

In [20]: print(m.get_constraint('c2'))
2 * x - y >= 1

```

### 3.4.5 Dropping components

You can drop a variable inside a model by using *Model.drop\_variable()* method. Similarly, you can drop a set of variables by using the *Model.drop\_variables()* method.

```

In [21]: m.drop_variable(y)

```

```

In [22]: print(m)
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (1): [
    x
  ]
  Constraints (2): [
    x + 2 * y <= 10
    2 * x - y >= 1
  ]
]

```

```

In [23]: m.include(y)

```

```

In [24]: print(m)
Model: [
  Name: model1

```

(continues on next page)

(continued from previous page)

```
Objective: MIN [0]
Variables (2): [
    x
    y
]
Constraints (2): [
    x + 2 * y <= 10
    2 * x - y >= 1
]
]
```

You can drop a constraint by using the `Model.drop_constraint()` method. Similarly, you can drop a set of constraints by using the `Model.drop_constraints()` method.

```
In [25]: m.drop_constraint(c1)
```

```
In [26]: m.drop_constraint(c2)
```

```
In [27]: print(m)
```

```
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (0): [
  ]
]
```

```
In [28]: m.include(c1)
```

```
In [29]: print(m)
```

```
Model: [
  Name: model1
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]
```

### 3.4.6 Copying a model

You can copy an existing model by including the *Model* object itself.

```
In [30]: copy_model = so.Model(name='copy_model')
NOTE: Initialized model copy_model.

In [31]: copy_model.include(m)

In [32]: print(copy_model)
Model: [
  Name: copy_model
  Objective: MIN [0]
  Variables (2): [
    x
    y
  ]
  Constraints (1): [
    x + 2 * y <= 10
  ]
]
```

Note that all variables and constraints are included by reference.

### 3.4.7 Solving a model

A model is solved by using the *Model.solve()* method. This method converts Python definitions into an MPS file and uploads it to a CAS server for the optimization action. The type of the optimization problem is determined based on the variable types and expressions.

```
>>> m.solve()
NOTE: Initialized model model_1
NOTE: Converting model model_1 to DataFrame
NOTE: Added action set 'optimization'.
...
NOTE: Optimal.
NOTE: Objective = 124.343.
NOTE: The Dual Simplex solve time is 0.01 seconds.
```

### 3.4.8 Solve options

#### Solver Options

You can pass both PROC OPTMODEL solve options and solveLp, solveMilp action options by using the options argument of the *Model.solve()* method.

```
>>> m.solve(options={'with': 'milp', 'maxtime': 600})
>>> m.solve(options={'with': 'lp', 'algorithm': 'ipm'})
```

The only special option for the *Model.solve()* method is with. If not passed, PROC OPTMODEL chooses a solver that depends on the problem type. Possible with options are listed in the [SAS/OR documentation](#).

You can find specific solver options in the SAS Optimization documentation:

- [LP solver options](#)

- MILP solver options
- NLP solver options
- QP solver options
- BLACKBOX solver options

The `options` argument can also pass `solveLp` and `solveMilp` action options when `frame=True` is used when calling the `Model.solve()` method.

- `solveLp` options
- `solveMilp` options

## Package Options

Besides the `options` argument, you can pass following arguments into the `Model.solve()` method:

- `name`: Name of the uploaded problem information
- `drop`: Option for dropping the data from server after the solve
- `replace`: Option for replacing an existing data with the same name
- `primalin`: Option for using the current values of the variables as an initial solution
- `submit`: Option for calling the CAS / SAS action
- `frame`: Option for using frame (MPS) method (if `False`, it uses `OPTMODEL`)
- `verbose`: Option for printing the generated `OPTMODEL` code before solve

When `primalin` argument is `True`, it grabs `Variable` objects `_init` field. You can modify this field by using the `Variable.set_init()` method.

## 3.4.9 Getting solutions

After the solve is completed, all variable and constraint values are parsed automatically. You can access a summary of the problem by using the `Model.get_problem_summary()` method, and a summary of the solution by using the `Model.get_solution_summary()` method.

To print the values of any object, you can use the `get_solution_table()` method:

```
>>> print(so.get_solution_table(x, y))
```

All variables and constraints passed into this method are returned based on their indices. See [Examples](#) for more details.

## 3.4.10 Tuning MILP model parameters

SAS Optimization solvers provide a variety of settings. However, it might be difficult to find the best settings for a given model. In order to compare and obtain a good choice of parameters, you can use the `optimization.tune` action for mixed-integer linear optimization problems.

The `Model.tune_parameters()` method is a wrapper for the `tune` action. Consider the following knapsack problem example:

```

In [33]: def get_model():
.....:     m = so.Model(name='knapsack_with_tuner', session=cas_conn)
.....:     data = [
.....:         ['clock', 8, 4, 3],
.....:         ['mug', 10, 6, 5],
.....:         ['headphone', 15, 7, 2],
.....:         ['book', 20, 12, 10],
.....:         ['pen', 1, 1, 15]
.....:     ]
.....:     df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit']).set_
↳index(['item'])
.....:     ITEMS = df.index
.....:     value = df['value']
.....:     weight = df['weight']
.....:     limit = df['limit']
.....:     total_weight = 55
.....:     get = m.add_variables(ITEMS, name='get', vartype=so.INT)
.....:     m.add_constraints((get[i] <= limit[i] for i in ITEMS), name='limit_con')
.....:     m.add_constraint(so.quick_sum(weight[i] * get[i] for i in ITEMS) <= total_
↳weight, name='weight_con')
.....:     total_value = so.quick_sum(value[i] * get[i] for i in ITEMS)
.....:     m.set_objective(total_value, name='total_value', sense=so.MAX)
.....:     return m
.....:

In [34]: m = get_model()
NOTE: Initialized model knapsack_with_tuner.

```

For this problem, you can compare configurations as follows:

```

In [35]: results = m.tune_parameters(tunerParameters={'maxConfigs': 10})
NOTE: Added action set 'optimization'.
NOTE: Uploading the problem DataFrame to the server.
NOTE: Cloud Analytic Services made the uploaded file available as table KNAPSACK_WITH_
↳TUNER in caslib CASUSER(casuser).
NOTE: The table KNAPSACK_WITH_TUNER has been created in caslib CASUSER(casuser) from_
↳binary data uploaded to Cloud Analytic Services.
NOTE: Start to tune the MILP

```

`Model.tune_parameters()` accepts three main arguments

- `milpParameters`
- `tunerParameters`
- `tuningParameters`

For a full set of tuning parameters and acceptable values of these arguments, see the SAS Optimization documentation<sup>1</sup>.

For the example problem, you can tune the *presolver*, *cutStrategy*, and *strongIter* settings, by using initial values and candidate values, and limit the maximum number of configurations and maximum running time as follows:

<sup>1</sup> [https://go.documentation.sas.com/?cdcId=pgmsascdc&cdcVersion=9.4\\_3.5&docsetId=casactmopt&docsetTarget=casactmopt\\_optimization\\_details37.htm](https://go.documentation.sas.com/?cdcId=pgmsascdc&cdcVersion=9.4_3.5&docsetId=casactmopt&docsetTarget=casactmopt_optimization_details37.htm)

```
In [37]: results = m.tune_parameters(
.....:     milpParameters={'maxtime': 10},
.....:     tunerParameters={'maxConfigs': 20, 'logfreq': 5},
.....:     tuningParameters=[
.....:         {'option': 'presolver', 'initial': 'none', 'values': ['basic',
↪ 'aggressive', 'none']},
.....:         {'option': 'cutStrategy'},
.....:         {'option': 'strongIter', 'initial': -1, 'values': [-1, 100, 1000]}
.....:     ])
.....:
```

NOTE: Added action set 'optimization'.

NOTE: Uploading the problem DataFrame to the server.

NOTE: Cloud Analytic Services made the uploaded file available as table KNAPSACK\_WITH\_TUNER in caslib CASUSER(casuser).

NOTE: The table KNAPSACK\_WITH\_TUNER has been created in caslib CASUSER(casuser) from ↪ binary data uploaded to Cloud Analytic Services.

NOTE: Start to tune the MILP

You can retrieve full details by using the `Model.get_tuner_results()` method.

## 3.5 Model components

In this section, several model components are discussed with examples. See [Examples](#) to learn more about how you can use these components to define optimization models.

### 3.5.1 Expressions

*Expression* objects represent linear and nonlinear mathematical expressions in *sasoptpy*.

#### Creating expressions

You can create an *Expression* object as follows:

```
In [1]: profit = so.Expression(5 * sales - 3 * material, name='profit')

In [2]: print(repr(profit))
sasoptpy.Expression(exp = 5 * sales - 3 * material, name='profit')
```

#### Nonlinear expressions

*Expression* objects are linear by default. It is possible to create nonlinear expressions, but there are some limitations.

```
In [3]: nonexp = sales ** 2 + (1 / material) ** 3

In [4]: print(nonexp)
(sales) ** (2) + ((1) / (material)) ** (3)
```

Currently, it is not possible to get or print values of nonlinear expressions. Moreover, if your model includes a nonlinear expression, you need to use SAS Viya 3.4 or later or any SAS version for solving your problem.

To use mathematical operations, you need to import *sasoptpy.math* functions.

#### Mathematical expressions

*sasoptpy* provides mathematical functions for generating mathematical expressions to be used in optimization models.

You need to import *sasoptpy.math* to your code to start by using these functions. Available mathematical functions are listed in [Math Functions](#).

```
In [5]: import sasoptpy.math as sm

In [6]: newexp = sm.max(sales, 10) ** 2

In [7]: print(newexp._expr())
(max(sales , 10)) ^ (2)
```

```
In [8]: import sasoptpy.math as sm

In [9]: angle = so.Variable(name='angle')

In [10]: newexp = sm.sin(angle) ** 2 + sm.cos(angle) ** 2

In [11]: print(newexp._expr())
(sin(angle)) ^ (2) + (cos(angle)) ^ (2)
```

## Operations

### Getting the current value

After the solve is completed, you can obtain the current value of an expression by using the *Expression.get\_value()* method:

```
>>> print(profit.get_value())
42.0
```

### Getting the dual value

You can retrieve the dual values of *Expression* objects by using *Variable.get\_dual()* and *Constraint.get\_dual()* methods.

```
>>> m.solve()
>>> ...
>>> print(x.get_dual())
1.0
```

### Addition

There are two ways to add elements to an expression. The first and simpler way creates a new expression at the end:

```
In [12]: tax = 0.5

In [13]: profit_after_tax = profit - tax

In [14]: print(repr(profit_after_tax))
sasoptpy.Expression(exp = 5 * sales - 3 * material - 0.5, name=None)
```

The second way, *Expression.add()* method, takes two arguments: the element to be added and the sign (1 or -1):

```
In [15]: profit_after_tax = profit.add(tax, sign=-1)

In [16]: print(profit_after_tax)
5 * sales - 3 * material - 0.5

In [17]: print(repr(profit_after_tax))
sasoptpy.Expression(exp = 5 * sales - 3 * material - 0.5, name=None)
```

If the expression is a temporary one, the addition is performed in place.

### Multiplication

You can multiply expressions with scalar values:

```
In [18]: investment = profit.mult(0.2)
```

```
In [19]: print(investment)
sales - 0.6 * material
```

### Summation

For faster summations compared to Python's native `sum` function, *sasoptpy* provides *sasoptpy.quick\_sum()*.

```
In [20]: import time
```

```
In [21]: x = m.add_variables(1000, name='x')
```

```
In [22]: t0 = time.time()
```

```
In [23]: e = so.quick_sum(2 * x[i] for i in range(1000))
```

```
In [24]: print(time.time()-t0)
0.17400622367858887
```

```
In [25]: t0 = time.time()
```

```
In [26]: f = sum(2 * x[i] for i in range(1000))
```

```
In [27]: print(time.time()-t0)
1.0344576835632324
```

### Renaming an expression

You can rename expressions by using the *Expression.set\_name()* method:

```
In [28]: e = so.Expression(x[5] + 2 * x[6], name='e1')
```

```
In [29]: print(repr(e))
sasoptpy.Expression(exp = x[5] + 2 * x[6], name='e1')
```

```
In [30]: e.set_name('e2');
```

```
In [31]: print(repr(e))
sasoptpy.Expression(exp = x[5] + 2 * x[6], name='e2')
```

### Copying an expression

You can copy an *Expression* by using the *Expression.copy()* method:

```
In [32]: copy_profit = profit.copy(name='copy_profit')
```

```
In [33]: print(repr(copy_profit))
sasoptpy.Expression(exp = 5 * sales - 3 * material, name='copy_profit')
```

## 3.5.2 Objective Functions

### Setting and getting an objective function

You can use any valid *Expression* as the objective function of a model. You can also use an existing expression as an objective function by using the `Model.set_objective()` method. The objective function of a model can be obtained by using the `Model.get_objective()` method.

```
>>> profit = so.Expression(5 * sales - 2 * material, name='profit')
>>> m.set_objective(profit, so.MAX)
>>> print(m.get_objective())
- 2.0 * material + 5.0 * sales
```

### Getting the value

After a solve, you can retrieve the objective value by using the `Model.get_objective_value()` method.

```
>>> m.solve()
>>> print(m.get_objective_value())
42.0
```

## 3.5.3 Variables

### Creating variables

You can create variables either standalone or inside a model.

#### Creating a variable outside a model

The first way to create a variable uses the default constructor.

```
>>> x = so.Variable(vartype=so.INT, ub=5, name='x')
```

When created separately, a variable needs to be included (or added) inside the model:

```
>>> y = so.Variable(name='y', lb=5)
>>> m.add_variable(y)
```

Equivalently, you could do this in one step:

```
>>> y = m.add_variable(name='y', lb=5)
```

#### Creating a variable inside a model

The second way is to use `Model.add_variable()`. This method creates a *Variable* object and returns a pointer.

```
>>> x = m.add_variable(vartype=so.INT, ub=5, name='x')
```

## Arguments

There are three types of variables: continuous variables, integer variables, and binary variables. Continuous variables are the default type and you can specify it by using the `vartype=so.CONT` argument. You can create Integer variables and binary variables by using the `vartype=so.INT` and `vartype=so.BIN` arguments, respectively.

The default lower bound for variables is 0, and the upper bound is infinity. Name is a required argument.

## Changing bounds

The `Variable.set_bounds()` method changes the bounds of a variable.

```
>>> x = so.Variable(name='x', lb=0, ub=20)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=0, ub=20, vartype='CONT')
>>> x.set_bounds(lb=5, ub=15)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=5, ub=15, vartype='CONT')
```

## Setting initial values

You can pass the initial values of variables to the solvers for certain problems. The `Variable.set_init()` method changes the initial value for variables. You can set this value at the creation of the variable as well.

```
>>> x.set_init(5)
>>> print(repr(x))
sasoptpy.Variable(name='x', ub=20, init=5, vartype='CONT')
```

## Working with a set of variables

You can create a set of variables by using single or multiple indices. Valid index sets include list, dict, and `pandas.Index` objects. See [Handling Data](#) for more information about allowed index types.

### Creating a set of variables outside a model

```
>>> production = VariableGroup(PERIODS, vartype=so.INT, name='production',
                               lb=min_production)
>>> print(repr(production))
sasoptpy.VariableGroup(['Period1', 'Period2', 'Period3'], name='production')
>>> m.include(production)
```

### Creating a set of variables inside a model

```
>>> production = m.add_variables(PERIODS, vartype=so.INT,
                                name='production', lb=min_production)
>>> print(production)
>>> print(repr(production))
Variable Group (production) [
  Period1: production['Period1',]
  Period2: production['Period2',]
  Period3: production['Period3',]
]
sasoptpy.VariableGroup(['Period1', 'Period2', 'Period3'],
name='production')
```

## 3.5.4 Constraints

### Creating constraints

Similar to *Variable* objects, you can create *Constraint* objects inside or outside optimization models.

#### Creating a constraint outside a model

```
>>> c1 = so.Constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
```

#### Creating a constraint inside a model

```
>>> c1 = m.add_constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
```

### Modifying variable coefficients

You can update the coefficient of a variable inside a constraint by using the *Constraint.update\_var\_coef()* method:

```
>>> c1 = so.Constraint(exp=3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
>>> c1.update_var_coef(x, -1)
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y - x <= 10, name='c1')
```

### Working with a set of constraints

You can add a set of constraints by using single or multiple indices. Valid index sets include list, dict, and *pandas.Index* objects. See *Handling Data* for more information about allowed index types.

#### Creating a set of constraints outside a model

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> cg = so.ConstraintGroup((2 * z[i, j] + 3 * z[i-1, j] >= 2 for i in
                             [1] for j in ['a', 'b', 'c']), name='cg')
>>> print(cg)
Constraint Group (cg) [
  [(1, 'a'): 3.0 * z[0, 'a'] + 2.0 * z[1, 'a'] >= 2]
  [(1, 'b'): 3.0 * z[0, 'b'] + 2.0 * z[1, 'b'] >= 2]
  [(1, 'c'): 2.0 * z[1, 'c'] + 3.0 * z[0, 'c'] >= 2]
]
```

#### Creating a set of constraints inside a model

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> cg2 = m.add_constraints((2 * z[i, j] + 3 * z[i-1, j] >= 2 for i in
                             [1] for j in ['a', 'b', 'c']), name='cg2')
>>> print(cg2)
Constraint Group (cg2) [
  [(1, 'a'): 2.0 * z[1, 'a'] + 3.0 * z[0, 'a'] >= 2]
```

(continues on next page)

(continued from previous page)

```
[ (1, 'b'): 3.0 * z[0, 'b'] + 2.0 * z[1, 'b'] >= 2]
[ (1, 'c'): 2.0 * z[1, 'c'] + 3.0 * z[0, 'c'] >= 2]
]
```

## Range constraints

You can give a range for an expression by using a list of two value (lower and upper bound) with an == sign:

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> c1 = m.add_constraint(x + 2*y == [2,9], name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( x + 2.0 * y == [2, 9], name='c1')
```

## 3.6 Workspaces

One of the most powerful features of SAS Optimization and PROC OPTMODEL is the ability to combine several optimization models in a single call. You can read a common data set once, or parallelize solve steps for similar subproblems by using this ability.

The newly introduced *Workspace* provides this ability in a familiar syntax. Compared to *Model* objects, a *Workspace* can consist of several models and is able to use server-side data and OPTMODEL statements in a more detailed way.

### 3.6.1 Creating a workspace

A *Workspace* should be called by using the *with* keyword of Python as follows:

```
>>> with so.Workspace('my_workspace') as w:
>>> ...
```

You can define several models in the same workspace, and solve problems multiple times. All the statements are sent to the server after *Workspace.submit()* is called.

### 3.6.2 Adding components

Unlike *Model* objects, where components are added explicitly, objects defined inside a *Workspace* are added automatically.

For example, adding a new variable is performed as follows:

```
In [1]: with so.Workspace(name='my_workspace') as w:
...:     x = so.Variable(name='x', vartype=so.integer)
...:
```

You can display contents of a workspace by using the *Workspace.to\_optmodel()* method:

```
In [2]: print(w.to_optmodel())
proc optmodel;
  var x integer;
quit;
```

See the following full example where data are loaded into the server, and a problem is solved by using a Workspace:

Create CAS session:

```
In [3]: import os

In [4]: hostname = os.getenv('CASHOST')

In [5]: port = os.getenv('CASPORT')

In [6]: from swat import CAS

In [7]: cas_conn = CAS(hostname, port)

In [8]: import sasoptpy as so

In [9]: import pandas as pd
```

Upload data:

```
In [10]: def send_data():
.....:     data = [
.....:         ['clock', 8, 4, 3],
.....:         ['mug', 10, 6, 5],
.....:         ['headphone', 15, 7, 2],
.....:         ['book', 20, 12, 10],
.....:         ['pen', 1, 1, 15]
.....:     ]
.....:     df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit'])
.....:     cas_conn.upload_frame(df, casout={'name': 'mydata', 'replace': True})
.....:     send_data()
.....:
```

NOTE: Cloud Analytic Services made the uploaded file available as table MYDATA in `caslib CASUSER(casuser)`.

NOTE: The table MYDATA has been created in `caslib CASUSER(casuser)` from binary data uploaded to Cloud Analytic Services.

Model workspace:

```
In [11]: from sasoptpy.actions import read_data, solve

In [12]: def create_workspace():
.....:     with so.Workspace('my_knapsack', session=cas_conn) as w:
.....:         items = so.Set(name='ITEMS', settype=so.string)
.....:         value = so.ParameterGroup(items, name='value')
.....:         weight = so.ParameterGroup(items, name='weight')
.....:         limit = so.ParameterGroup(items, name='limit')
.....:         total_weight = so.Parameter(name='total_weight', value=55)
.....:         read_data(
.....:             table='mydata', index={'target': items, 'key': ['item']},
.....:             columns=[value, weight, limit]
.....:         )
.....:         get = so.VariableGroup(items, name='get', vartype=so.integer, lb=0)
.....:         limit_con = so.ConstraintGroup((get[i] <= limit[i] for i in items),
.....:                                     name='limit_con')
.....:         weight_con = so.Constraint(
.....:             so.expr_sum(weight[i] * get[i] for i in items) <= total_weight,
.....:             name='weight_con')
```

(continues on next page)

(continued from previous page)

```

.....:         total_value = so.Objective(
.....:             so.expr_sum(value[i] * get[i] for i in items), name='total_value',
.....:             sense=so.maximize)
.....:         solve()
.....:         return w
.....:

```

```
In [13]: my_workspace = create_workspace()
```

Print content:

```
In [14]: print(so.to_optmodel(my_workspace))
proc optmodel;
    set <str> ITEMS;
    num value {ITEMS};
    num weight {ITEMS};
    num limit {ITEMS};
    num total_weight = 55;
    read data mydata into ITEMS=[item] value weight limit;
    var get {{ITEMS}} integer >= 0;
    con limit_con {o72 in ITEMS} : get[o72] - limit[o72] <= 0;
    con weight_con : total_weight - (sum {i in ITEMS} (weight[i] * get[i])) >= 0;
    max total_value = sum {i in ITEMS} (value[i] * get[i]);
    solve;
quit;
```

Submit:

```
In [15]: my_workspace.submit()
NOTE: Added action set 'optimization'.
NOTE: There were 5 rows read from table 'MYDATA' in caslib 'CASUSER(casuser)'.
NOTE: Problem generation will use 8 threads.
NOTE: The problem has 5 variables (0 free, 0 fixed).
NOTE: The problem has 0 binary and 5 integer variables.
NOTE: The problem has 6 linear constraints (5 LE, 0 EQ, 1 GE, 0 range).
NOTE: The problem has 10 linear constraint coefficients.
NOTE: The problem has 0 nonlinear constraints (0 LE, 0 EQ, 0 GE, 0 range).
NOTE: The OPTMODEL presolver is disabled for linear problems.
NOTE: The initial MILP heuristics are applied.
NOTE: The MILP presolver value AUTOMATIC is applied.
NOTE: The MILP presolver removed 0 variables and 5 constraints.
NOTE: The MILP presolver removed 5 constraint coefficients.
NOTE: The MILP presolver modified 0 constraint coefficients.
NOTE: The presolved problem has 5 variables, 1 constraints, and 5 constraint_
↪coefficients.
NOTE: The MILP solver is called.
NOTE: The parallel Branch and Cut algorithm is used.
NOTE: The Branch and Cut algorithm is using up to 8 threads.
```

Node	Active	Sols	BestInteger	BestBound	Gap	Time
0	1	4	99.0000000	199.0000000	50.25%	0
0	1	4	99.0000000	102.3333333	3.26%	0

### 3.6.3 Abstract actions

As shown in the previous example, a *Workspace* can have statements such as `actions.read_data()` and `actions.solve()`.

These statements are called “Abstract Statements” and are fully supported inside *Workspace* objects.

#### Adding abstract actions

You can import abstract actions through `sasoptpy.actions` as follows:

```
>>> from sasoptpy.actions import read_data, create_data
```

These abstract actions are performed on the server side by generating equivalent OPTMODEL code at execution.

#### Grabbing results

In order to solve a problem, you need to use the `actions.solve()` function explicitly. Because *Workspace* objects allow several models and solve statements to be included, each of these solve statements are retrieved separately. You can return the solution after each solve by using the `actions.print()` function or creating a table by using the `actions.create_data()` function.

See the following example where a parameter is changed and the same problem solved twice:

```
In [16]: from sasoptpy.actions import read_data, solve, print_item

In [17]: def create_multi_solve_workspace():
....:     with so.Workspace('my_knapsack', session=cas_conn) as w:
....:         items = so.Set(name='ITEMS', settype=so.string)
....:         value = so.ParameterGroup(items, name='value')
....:         weight = so.ParameterGroup(items, name='weight')
....:         limit = so.ParameterGroup(items, name='limit')
....:         total_weight = so.Parameter(name='total_weight', init=55)
....:         read_data(table='mydata', index={'target': items, 'key': ['item']},
→columns=[value, weight, limit])

## List of abstract actions

A list of abstract actions is available in the [API section](#).

## 3.7 Handling Data

*sasoptpy* can work with native Python types and *pandas* objects for all data operations. Among *pandas* object types, *sasoptpy* works with `pandas.DataFrame` and `pandas.Series` objects to construct and manipulate model components.

### 3.7.1 Indices

Methods like `Model.add_variables()` can utilize native Python object types like list and range as variable and constraint indices. You can use `pandas.Index` objects as indices as well.

## List

```
In [1]: m = so.Model(name='demo')
NOTE: Initialized model demo.

In [2]: SEASONS = ['Fall', 'Winter', 'Spring', 'Summer']

In [3]: prod_lb = {'Fall': 100, 'Winter': 200, 'Spring': 100, 'Summer': 400}

In [4]: production = m.add_variables(SEASONS, lb=prod_lb, name='production')

In [5]: print(production)
Variable Group (production) [
  [Fall: production[Fall]]
  [Winter: production[Winter]]
  [Spring: production[Spring]]
  [Summer: production[Summer]]
]

In [6]: print(repr(production['Summer']))
sasoptpy.Variable(name='production[Summer]', lb=400, vartype='CONT')
```

Note that if a list is being used as the index set, associated fields like *lb*, *ub* should be accessible by using the index keys. Accepted types are dict and `pandas.Series`.

## Range

```
In [7]: link = m.add_variables(range(3), range(2), vartype=so.BIN, name='link')

In [8]: print(link)
Variable Group (link) [
  [(0, 0): link[0, 0]]
  [(0, 1): link[0, 1]]
  [(1, 0): link[1, 0]]
  [(1, 1): link[1, 1]]
  [(2, 0): link[2, 0]]
  [(2, 1): link[2, 1]]
]

In [9]: print(repr(link[2, 1]))
sasoptpy.Variable(name='link[2,1]', lb=0, ub=1, vartype='BIN')
```

## pandas.Index

```
In [10]: import pandas as pd

In [11]: p_data = [[3, 5, 9],
.....:             [0, -1, 14],
.....:             [5, 6, 20]]
.....:

In [12]: df = pd.DataFrame(p_data, columns=['c1', 'col_lb', 'col_ub'])

In [13]: x = m.add_variables(df.index, lb=df['c1'], vartype=so.INT, name='x')
```

```
In [14]: print(x)
Variable Group (x) [
  [0: x[0]]
  [1: x[1]]
  [2: x[2]]
]
```

```
In [15]: df2 = df.set_index(['r1', 'r2', 'r3'])
```

```
In [16]: y = m.add_variables(df2.index, lb=df2['col_lb'], ub=df2['col_ub'], name='y')
```

```
In [17]: print(y)
Variable Group (y) [
  [r1: y[r1]]
  [r2: y[r2]]
  [r3: y[r3]]
]
```

```
In [18]: print(repr(y['r1']))
sasoptpy.Variable(name='y[r1]', lb=5, ub=9, vartype='CONT')
```

## Set

*sasoptpy* can work with data on the server and generate abstract expressions. For this purpose, you can use *Set* objects to represent PROC OPTMODEL sets.

```
In [19]: m2 = so.Model(name='m2')
NOTE: Initialized model m2.

In [20]: I = m2.add_set(name='I')

In [21]: u = m2.add_variables(I, name='u')

In [22]: print(I, u)
I Variable Group (u) [
]
```

See [Workflows](#) for more information on working with server-side models.

### 3.7.2 Data

*sasoptpy* can work with both client-side and server-side data. Here are some options to load data into the optimization models.

#### pandas DataFrame

`pandas.DataFrame` is the preferred object type when passing data into *sasoptpy* models.

```
In [23]: data = [
.....:     ['clock', 8, 4, 3],
.....:     ['mug', 10, 6, 5],
.....:     ['headphone', 15, 7, 2],
.....:     ['book', 20, 12, 10],
.....:     ['pen', 1, 1, 15]
.....: ]

In [24]: df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit']).set_
↳index(['item'])

In [25]: get = so.VariableGroup(df.index, ub=df['limit'], name='get')

In [26]: print(get)
Variable Group (get) [
  [clock: get[clock]]
  [mug: get[mug]]
  [headphone: get[headphone]]
  [book: get[book]]
  [pen: get[pen]]
]
```

#### Dictionaries

You can use lists and dictionaries in expressions and when creating variables.

```
In [27]: items = ['clock', 'mug', 'headphone', 'book', 'pen']

In [28]: limits = {'clock': 3, 'mug': 5, 'headphone': 2, 'book': 10, 'pen': 15}

In [29]: get2 = so.VariableGroup(items, ub=limits, name='get2')

In [30]: print(get2)
Variable Group (get2) [
  [clock: get2[clock]]
  [mug: get2[mug]]
  [headphone: get2[headphone]]
  [book: get2[book]]
  [pen: get2[pen]]
]
```

## CASTable

When data are available on the server-side, you can pass a reference to the object. Note that, using `swat.cas.table.CASTable` and Abstract Data requires SAS Viya version 3.4 or later.

```
In [31]: m2 = so.Model(name='m2', session=session)
NOTE: Initialized model m2.
```

```
In [32]: table = session.upload_frame(df)
NOTE: Cloud Analytic Services made the uploaded file available as table TMPF133XWPN_
↳in caslib CASUSER(casuser).
NOTE: The table TMPF133XWPN has been created in caslib CASUSER(casuser) from binary_
↳data uploaded to Cloud Analytic Services.
```

```
In [33]: print(type(table), table)
<class 'swat.cas.table.CASTable'> CASTable('TMPF133XWPN', caslib='CASUSER(casuser)')
```

```
In [34]: df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit'])
```

```
In [35]: ITEMS = m.add_set(name='ITEMS')
```

```
In [36]: value = m.add_parameter(ITEMS, name='value')
```

```
In [37]: weight = m.add_parameter(ITEMS, name='weight')
```

```
In [38]: limit = m.add_parameter(ITEMS, name='limit')
```

```
In [39]: from sasoptpy.actions import read_data
```

```
In [40]: m.include(read_data(table=table, index={'target': ITEMS, 'key': None},
....:                                     columns=[value, weight, limit]))
....:
```

```
In [41]: get3 = m2.add_variables(ITEMS, name='get3')
```

```
In [42]: print(get3)
Variable Group (get3) [
]
```

## Abstract Data

If you would like to model your problem first and then load data, you can pass a string for the data sets that will be available later.

```
In [43]: from sasoptpy.actions import read_data
```

```
In [44]: m3 = so.Model(name='m3', session=session)
NOTE: Initialized model m3.
```

```
In [45]: ITEMS = m.add_set(name='ITEMS')
```

```
In [46]: limit = m.add_parameter(ITEMS, name='limit')
```

```
In [47]: m3.include(read_data(table='DF', index=['item'], columns=[limit]))
```

(continues on next page)

(continued from previous page)

```
In [48]: print(type(ITEMS), ITEMS)
<class 'sasoptpy.abstract.set.Set'> ITEMS
```

Note that the key set is created as a reference. You can later solve the problem after having the data available with the same name; for example, by using the *upload\_frame* function.

```
In [49]: session.upload_frame(df, casout='DF')
NOTE: Cloud Analytic Services made the uploaded file available as table DF in caslib_
↳CASUSER(casuser).
NOTE: The table DF has been created in caslib CASUSER(casuser) from binary data_
↳uploaded to Cloud Analytic Services.
Out[49]: CASTable('DF', caslib='CASUSER(casuser)')
```

### 3.7.3 Operations

You can use lists, `pandas.Series`, and `pandas.DataFrame` objects for mathematical operations such as `VariableGroup.mult()`.

```
In [50]: sd = [3, 5, 6]
```

```
In [51]: z = m.add_variables(3, name='z')
```

```
In [52]: print(z)
Variable Group (z) [
  [0: z[0]]
  [1: z[1]]
  [2: z[2]]
]
```

```
In [53]: print(repr(z))
sasoptpy.VariableGroup([0, 1, 2], name='z')
```

```
In [54]: e1 = z.mult(sd)
```

```
In [55]: print(e1)
3 * z[0] + 5 * z[1] + 6 * z[2]
```

```
In [56]: ps = pd.Series(sd)
```

```
In [57]: e2 = z.mult(ps)
```

```
In [58]: print(e2)
3 * z[0] + 5 * z[1] + 6 * z[2]
```

## 3.8 Workflows

*sasoptpy* can work with both client-side data and server-side data. Some limitations to the functionalities might apply in terms of which workflow is being used. In this section, the overall flow of the package is explained.

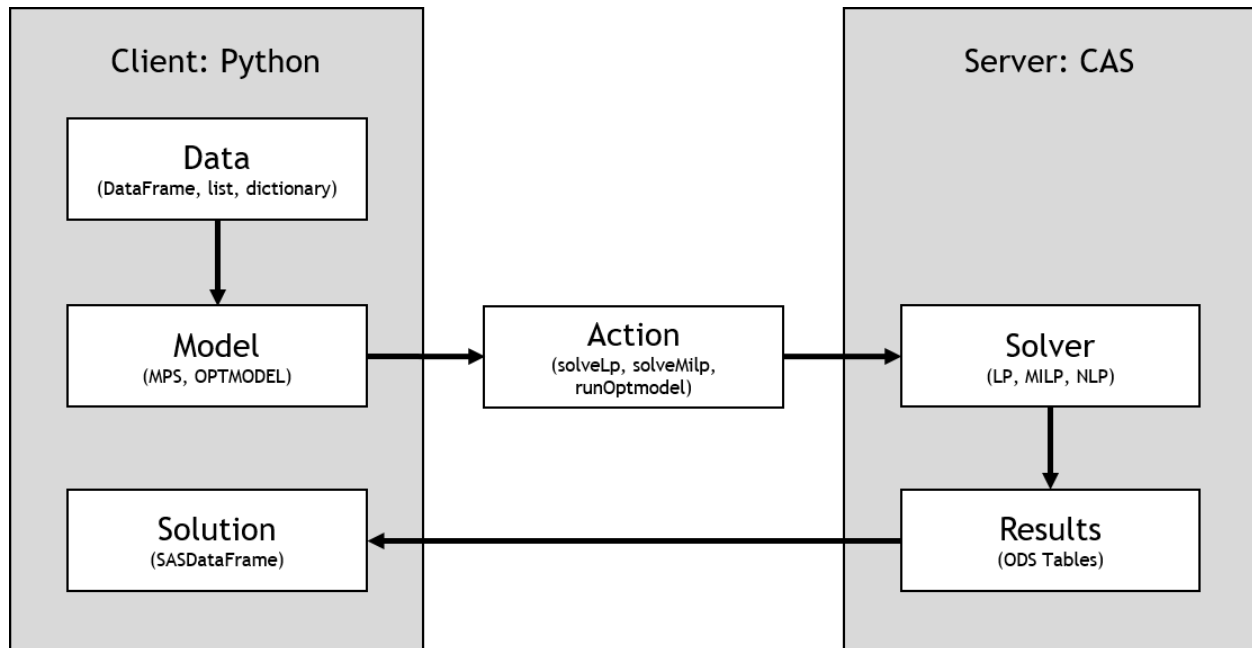

### 3.8.1 Client-side models

If the data are on the client-side (Python), then a concrete model is generated on the client-side and uploaded by using one of the available CAS actions.

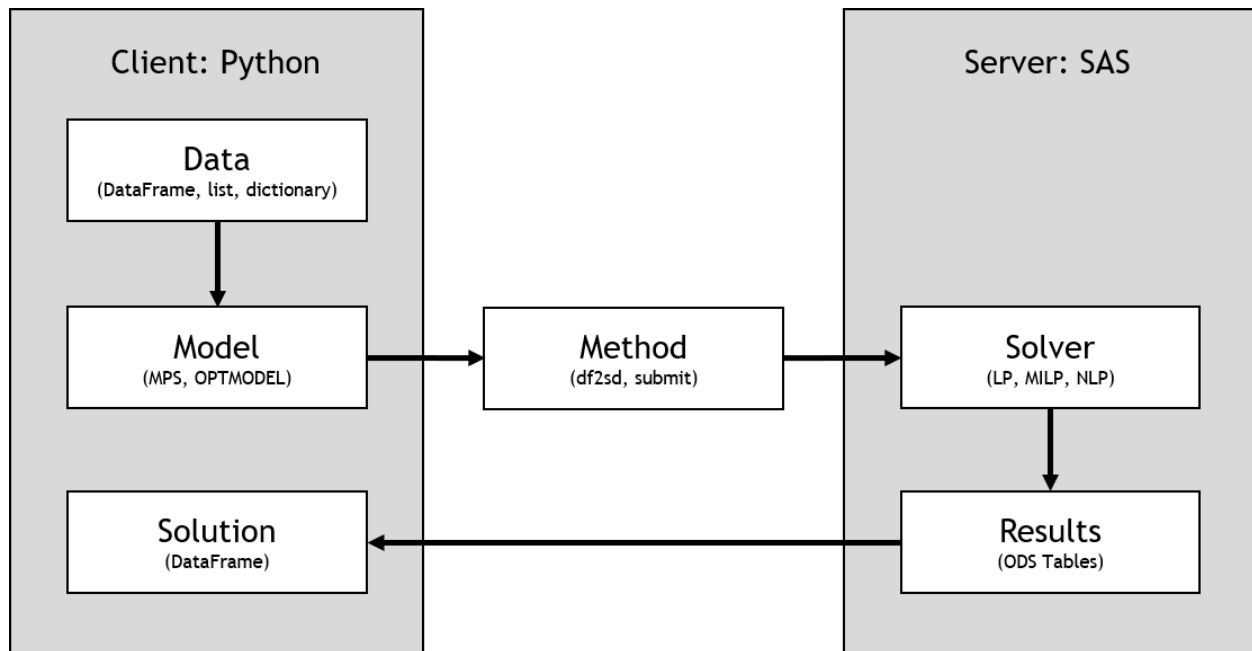

Using a client-side model brings several advantages, such as accessing variables, expressions, and constraints directly. You can do more intensive operations like filter data, sort values, change variable values, and print expressions more easily.

There are two main disadvantages of working with client-side models. First, if your model is relatively large, the generated MPS DataFrame or OPTMODEL code might allocate a large memory on your machine. Second, the information that needs to be passed from client to server might be larger compared to using a server-side model.

See the following representation of the client-side model workflow for CAS (Viya) servers:

See the following representation of the client-side model workflow for SAS clients:

Steps of modeling a simple knapsack problem are shown in the following subsections.

### Reading data

```

In [1]: import sasoptpy as so

In [2]: import pandas as pd

In [3]: from swat import CAS

In [4]: session = CAS(hostname, port)

In [5]: m = so.Model(name='client_CAS', session=session)
NOTE: Initialized model client_CAS.

In [6]: data = [
...:     ['clock', 8, 4, 3],
...:     ['mug', 10, 6, 5],
...:     ['headphone', 15, 7, 2],
...:     ['book', 20, 12, 10],
...:     ['pen', 1, 1, 15]
...: ]

In [7]: df = pd.DataFrame(data, columns=['item', 'value', 'weight', 'limit'])

In [8]: ITEMS = df.index

In [9]: value = df['value']

In [10]: weight = df['weight']

In [11]: limit = df['limit']
  
```

(continues on next page)

(continued from previous page)

```
In [12]: total_weight = 55
```

```
In [13]: print(type(ITEMS), ITEMS)
<class 'pandas.core.indexes.range.RangeIndex'> RangeIndex(start=0, stop=5, step=1)
```

```
In [14]: print(type(total_weight), total_weight)
<class 'int'> 55
```

Here, you can obtain the column values one by one:

```
>>> df = df.set_index('item')
>>> ITEMS = df.index.tolist()
>>> value = df['value']
>>> weight = df['weight']
>>> limit = df['limit']
```

## Model

```
# Variables
In [15]: get = m.add_variables(ITEMS, name='get', vartype=so.INT, lb=0)

# Constraints
In [16]: m.add_constraints((get[i] <= limit[i] for i in ITEMS), name='limit_con');

In [17]: m.add_constraint(
.....:     so.quick_sum(weight[i] * get[i] for i in ITEMS) <= total_weight,
.....:     name='weight_con');
.....:

# Objective
In [18]: total_value = so.expr_sum(value[i] * get[i] for i in ITEMS)

In [19]: m.set_objective(total_value, name='total_value', sense=so.MAX);

# Solve
In [20]: m.solve(verbose=True)
NOTE: Added action set 'optimization'.

↪columns.
NOTE: The CAS table 'problemSummary' in caslib 'CASUSER(casuser)' has 20 rows and 4_
↪columns.
Out [20]:
Selected Rows from Table SOLUTION

      i    var  value  lb          ub  rc
0  1.0  get[0]   2.0 -0.0  1.797693e+308 NaN
1  2.0  get[1]   5.0 -0.0  1.797693e+308 NaN
2  3.0  get[2]   2.0 -0.0  1.797693e+308 NaN
3  4.0  get[3]  -0.0 -0.0  1.797693e+308 NaN
4  5.0  get[4]   3.0 -0.0  1.797693e+308 NaN

```

You can display the generated OPTMODEL code at runtime by using the `verbose` option. Here, you can see the coefficient values of the parameters inside the model.

## Parsing results

After the solve, the primal and dual solution tables are obtained. You can print the solution tables by using the `Model.get_solution()` method.

It is also possible to print the optimal solution by using the `get_solution_table()` function.

```

In [21]: print(m.get_solution())
Selected Rows from Table SOLUTION

      i    var  value  lb          ub  rc
0  1.0  get[0]   2.0 -0.0  1.797693e+308 NaN

```

(continues on next page)

(continued from previous page)

### 3.8.2 Server-side models

If the data are on the server-side (CAS or SAS), then an abstract model is generated on the client-side. This abstract model is later converted to PROC OPTMODEL code, which reads the data on the server.

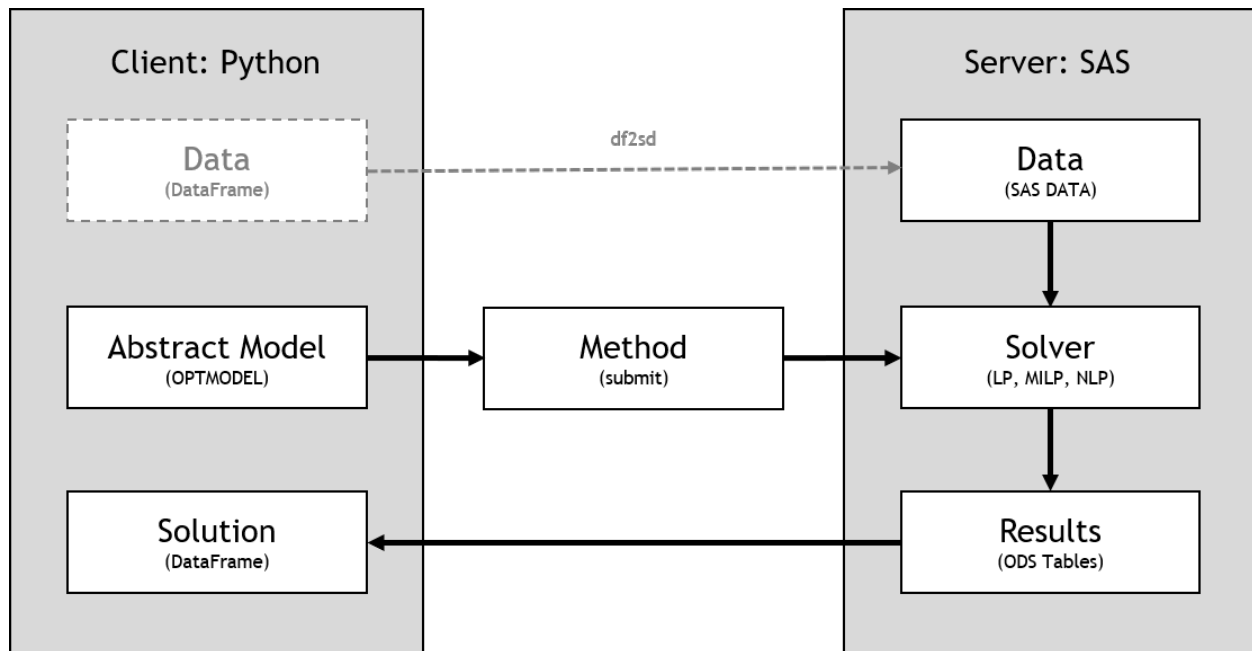

The main advantage of the server-side models is faster upload times compared to client-side. This is especially noticeable when using large numbers of variable and constraint groups.

The only disadvantage of using server-side models is that variables often need to be accessed directly from the resulting SASDataFrame objects. Because components of the models are abstract, accessing objects directly is often not possible.

See the following representation of the server-side model workflow for CAS (Viya) servers:

See the following representation of the server-side model workflow for SAS clients:

In the following subsections, the same example is solved by using server-side data.

## Model

```
In [24]: from sasoptpy.actions import read_data
```

```
In [25]: m = so.Model(name='client_CAS', session=session)
```

NOTE: Initialized model client\_CAS.

```
In [26]: cas_table = session.upload_frame(df, casout='data')
```

NOTE: Cloud Analytic Services made the uploaded file available as table DATA in

↳ caslib CASUSER(casuser).

NOTE: The table DATA has been created in caslib CASUSER(casuser) from binary data

↳ uploaded to Cloud Analytic Services.

```
In [27]: ITEMS = m.add_set(name='ITEMS', settype=so.STR)
```

```
In [28]: value = m.add_parameter(ITEMS, name='value')
```

```
In [29]: weight = m.add_parameter(ITEMS, name='weight')
```

```
In [30]: limit = m.add_parameter(ITEMS, name='limit')
```

```
In [31]: m.include(read_data(
.....:     table=cas_table, index={'target':ITEMS, 'key': 'item'},
.....:     columns=[value, weight, limit]))
.....:
```

# Variables

```
In [32]: get = m.add_variables(ITEMS, name='get', vartype=so.INT, lb=0)
```

# Constraints

```
In [33]: m.add_constraints((get[i] <= limit[i] for i in ITEMS), name='limit_con');
```

(continues on next page)

(continued from previous page)

```

In [34]: m.add_constraint(
.....:     so.quick_sum(weight[i] * get[i] for i in ITEMS) <= total_weight,
.....:     name='weight_con');
.....:

# Objective
In [35]: total_value = so.quick_sum(value[i] * get[i] for i in ITEMS)

In [36]: m.set_objective(total_value, name='total_value', sense=so.MAX);

# Solve
In [37]: m.solve(verbose=True)
NOTE: Added action set 'optimization'.
NOTE: Converting model client_CAS to OPTMODEL.
    set <str> ITEMS;
    num value {{ITEMS}};
    num weight {{ITEMS}};
    num limit {{ITEMS}};
    read data DATA into ITEMS=[item] value weight limit;
    var get {{ITEMS}} integer >= 0;
    con limit_con {o37 in ITEMS} : get[o37] - limit[o37] <= 0;
    con weight_con : sum {i in ITEMS} (weight[i] * get[i]) <= 55;
    max total_value = sum {i in ITEMS} (value[i] * get[i]);
    solve;
    create data solution from [i]= {1..NVAR_} var=_VAR_.name value=_VAR_ lb=_VAR_.lb_
↳ub=_VAR_.ub rc=_VAR_.rc;
    create data dual from [j] = {1..NCON_} con=_CON_.name value=_CON_.body dual=_CON_.
↳dual;

NOTE: Submitting OPTMODEL code to CAS server.

NOTE: The problem has 0 binary and 5 integer variables.
NOTE: The problem has 6 linear constraints (6 LE, 0 EQ, 0 GE, 0 range).
NOTE: The problem has 10 linear constraint coefficients.
NOTE: The problem has 0 nonlinear constraints (0 LE, 0 EQ, 0 GE, 0 range).
NOTE: The OPTMODEL presolver is disabled for linear problems.
NOTE: The initial MILP heuristics are applied.
NOTE: The MILP presolver value AUTOMATIC is applied.
NOTE: The MILP presolver removed 0 variables and 5 constraints.
NOTE: The MILP presolver removed 5 constraint coefficients.
NOTE: The MILP presolver modified 0 constraint coefficients.
NOTE: The presolved problem has 5 variables, 1 constraints, and 5 constraint_
↳coefficients.
NOTE: The MILP solver is called.
NOTE: The parallel Branch and Cut algorithm is used.
NOTE: The Branch and Cut algorithm is using up to 8 threads.

```

Node	Active	Sols	BestInteger	BestBound	Gap	Time
0	1	4	99.0000000	199.0000000	50.25%	0
0	1	4	99.0000000	102.3333333	3.26%	0
0	0	4	99.0000000	99.0000000	0.00%	0

```

NOTE: Optimal.
NOTE: Objective = 99.
NOTE: The output table 'SOLUTION' in caslib 'CASUSER(casuser)' has 5 rows and 6_
↳columns.

```

(continues on next page)

(continued from previous page)

NOTE: The output table 'DUAL' in caslib 'CASUSER(casuser)' has 6 rows and 4 columns.  
 NOTE: The CAS table 'solutionSummary' in caslib 'CASUSER(casuser)' has 18 rows and 4

columns.  
 NOTE: The CAS table 'problemSummary' in caslib 'CASUSER(casuser)' has 20 rows and 4

Out [37]:

Selected Rows from Table SOLUTION

	i	var	value	lb	ub	rc
0	1.0	get[book]	2.0	-0.0	1.797693e+308	NaN
1	2.0	get[clock]	3.0	-0.0	1.797693e+308	NaN
2	3.0	get[headphone]	2.0	-0.0	1.797693e+308	NaN
3	4.0	get[mug]	-0.0	-0.0	1.797693e+308	NaN
4	5.0	get[pen]	5.0	-0.0	1.797693e+308	NaN

## Parsing results

```
# Print results
```

```
In [38]: print(m.get_solution())
```

Selected Rows from Table SOLUTION

	i	var	value	lb	ub	rc
0	1.0	get[book]	2.0	-0.0	1.797693e+308	NaN
1	2.0	get[clock]	3.0	-0.0	1.797693e+308	NaN
2	3.0	get[headphone]	2.0	-0.0	1.797693e+308	NaN
3	4.0	get[mug]	-0.0	-0.0	1.797693e+308	NaN
4	5.0	get[pen]	5.0	-0.0	1.797693e+308	NaN

```
In [39]: print('Total value:', m.get_objective_value())
```

Total value: 99.0

Because there is no direct access to expressions and variables, the optimal solution is printed by using the server response.

## 3.8.3 Limitations

- In SAS Viya, nonlinear models can be solved only by using the runOptmodel action, which requires the SAS Viya version to be 3.4 or later.
- User-defined decomposition blocks are available only in MPS mode, and therefore only work with client-side data.
- Mixed usage (client-side and server-side data) might not work in some cases. A quick fix would be transferring the data in either direction.

## EXAMPLES

Examples are provided from [SAS/OR documentation](#).

### 4.1 Viya Examples / Concrete

#### 4.1.1 Food Manufacture 1

## API REFERENCE

### 5.1 Core

#### 5.1.1 Model

##### Constructor

---

<code>Model(**kwargs)</code>	Creates an optimization model
------------------------------	-------------------------------

---

##### `sasoptpy.Model`

**class** `Model` (*\*\*kwargs*)

Bases: `object`

Creates an optimization model

##### Parameters

**name** [string] Name of the model

**session** [`swat.cas.connection.CAS` or `saspy.SASsession`, optional] CAS or SAS  
Session object

##### Examples

```
>>> from swat import CAS
>>> import sasoptpy as so
>>> s = CAS('cas.server.address', port=12345)
>>> m = so.Model(name='my_model', session=s)
NOTE: Initialized model my_model
```

```
>>> mip = so.Model(name='mip')
NOTE: Initialized model mip
```

## Components

<code>Model.get_name(self)</code>	Returns model name
<code>Model.set_session(self, session)</code>	Sets the session of model (SAS Viya via swat or SAS 9.4 via saspy)
<code>Model.get_session(self)</code>	Returns the session of the model
<code>Model.get_session_type(self)</code>	Tests if the model session is defined and still active
<code>Model.set_objective(self, expression, name)</code>	Sets the objective function for the model
<code>Model.append_objective(self, expression, name)</code>	Appends a new objective to the model
<code>Model.get_objective(self)</code>	Returns the objective function as an <i>Expression</i> object
<code>Model.get_all_objectives(self)</code>	Returns a list of objectives in the model
<code>Model.add_variable(self, name[, vartype, ...])</code>	Adds a new variable to the model
<code>Model.add_variables(self, *argv[, name, ...])</code>	Adds a group of variables to the model
<code>Model.add_implicit_variable(self[, argv, name])</code>	Adds an implicit variable to the model
<code>Model.get_variable(self, name)</code>	Returns the reference to a variable in the model
<code>Model.get_variables(self)</code>	Returns a list of variables
<code>Model.get_grouped_variables(self)</code>	Get an ordered dictionary of variables, grouped based on creation
<code>Model.get_implicit_variables(self)</code>	Returns a list of implicit variables
<code>Model.get_variable_coef(self, var)</code>	Returns the objective value coefficient of a variable
<code>Model.drop_variable(self, variable)</code>	Drops a variable from the model
<code>Model.drop_variables(self, variables)</code>	Drops a variable group from the model
<code>Model.add_constraint(self, c, name)</code>	Adds a single constraint to the model
<code>Model.add_constraints(self, argv[, name])</code>	Adds a set of constraints to the model
<code>Model.get_constraint(self, name)</code>	Returns the reference to a constraint in the model
<code>Model.get_constraints(self)</code>	Returns a list of constraints in the model
<code>Model.get_grouped_constraints(self)</code>	Get an ordered dictionary of constraints, grouped based on creation
<code>Model.drop_constraint(self, constraint)</code>	Drops a constraint from the model
<code>Model.drop_constraints(self, constraints)</code>	Drops a constraint group from the model
<code>Model.add_set(self, name[, init, value, settype])</code>	Adds a set to the model
<code>Model.add_parameter(self, *argv[, name, ...])</code>	Adds a parameter to the model
<code>Model.add_statement(self, statement[, ...])</code>	Adds a PROC OPTMODEL statement to the model
<code>Model.get_sets(self)</code>	Returns a list of <i>Set</i> objects in the model
<code>Model.get_parameters(self)</code>	Returns a list of <i>Parameter</i> objects in the model
<code>Model.get_statements(self)</code>	Returns a list of all abstract statements inside the model.
<code>Model.include(self, *argv)</code>	Adds existing variables and constraints to a model

### **sasoptpy.Model.get\_name**

`Model.get_name(self)`  
Returns model name

### **sasoptpy.Model.set\_session**

`Model.set_session(self, session)`  
Sets the session of model (SAS Viya via swat or SAS 9.4 via saspy)

#### **Parameters**

**session** [`swat.cas.connection.CAS` or `saspy.SASsession`] CAS or SAS Session object

#### **Notes**

- Session of a model can be set at initialization. See [Model](#).

### **sasoptpy.Model.get\_session**

`Model.get_session(self)`  
Returns the session of the model

#### **Returns**

**session** [`swat.cas.connection.CAS` or `saspy.SASsession`] Session of the model, or None

### **sasoptpy.Model.get\_session\_type**

`Model.get_session_type(self)`  
Tests if the model session is defined and still active

#### **Returns**

**session** [string] 'CAS' for CAS sessions, 'SAS' for SAS sessions, None otherwise

### **sasoptpy.Model.set\_objective**

`Model.set_objective(self, expression, name, sense=None)`  
Sets the objective function for the model

#### **Parameters**

**expression** [Expression] The objective function as an Expression

**name** [string] Name of the objective value

**sense** [string, optional] Objective value direction, 'MIN' or 'MAX'

#### **Returns**

**objective** [Expression] Objective function as an [Expression](#) object

See also:

*Model.append\_objective()*

## Notes

- Default objective sense is minimization (MIN)
- This method replaces the existing objective of the model. When working with multiple objectives, use *Model.append\_objective()* method.

## Examples

```
>>> profit = so.Expression(5 * sales - 2 * material, name='profit')
>>> m.set_objective(profit, so.MAX)
>>> print(m.get_objective())
- 2.0 * material + 5.0 * sales
```

```
>>> m.set_objective(4 * x - 5 * y, name='obj')
>>> print(repr(m.get_objective()))
sasoptpy.Expression(exp = 4.0 * x - 5.0 * y, name='obj')
```

```
>>> f1 = m.set_objective(2 * x + y, sense=so.MIN, name='f1')
>>> f2 = m.append_objective((x - y) ** 2, sense=so.MIN, name='f2')
>>> print(m.to_optmodel(options={'with': 'blackbox', 'obj': (f1, f2)}))
proc optmodel;
var x;
var y;
min f1 = 2 * x + y;
min f2 = (x - y) ^ (2);
solve with blackbox obj (f1 f2);
print _var_.name _var_.lb _var_.ub _var_ _var_.rc;
print _con_.name _con_.body _con_.dual;
quit;
```

## sasoptpy.Model.append\_objective

**Model.append\_objective** (*self*, *expression*, *name*, *sense=None*)

Appends a new objective to the model

### Parameters

**expression** [Expression] The objective function as an Expression

**name** [string] Name of the objective value

**sense** [string, optional] Objective value direction, 'MIN' or 'MAX'

### Returns

**objective** [Expression] Objective function as an *Expression* object

See also:

*Model.set\_objective()*

## Notes

- Default objective sense is minimization (MIN)

## Examples

```
>>> f1 = m.set_objective(2 * x + y, sense=so.MIN, name='f1')
>>> f2 = m.append_objective( (x - y) ** 2, sense=so.MIN, name='f2')
>>> print(m.to_optmodel(options={'with': 'blackbox', 'obj': (f1, f2)}))
proc optmodel;
var x;
var y;
min f1 = 2 * x + y;
min f2 = (x - y) ^ (2);
solve with blackbox obj (f1 f2);
print _var_.name _var_.lb _var_.ub _var_ _var_.rc;
print _con_.name _con_.body _con_.dual;
quit;
```

## sasoptpy.Model.get\_objective

`Model.get_objective(self)`

Returns the objective function as an *Expression* object

### Returns

**objective** [Expression] Objective function

## Examples

```
>>> m.set_objective(4 * x - 5 * y, name='obj')
>>> print(repr(m.get_objective()))
sasoptpy.Expression(exp = 4.0 * x - 5.0 * y, name='obj')
```

## sasoptpy.Model.get\_all\_objectives

`Model.get_all_objectives(self)`

Returns a list of objectives in the model

### Returns

**all\_objectives** [list] A list of *Objective* objects

## Examples

```
>>> m = so.Model(name='test_set_get_objective')
>>> x = m.add_variable(name='x')
>>> obj1 = m.set_objective(2 * x, sense=so.MIN, name='obj1')
>>> obj2 = m.set_objective(5 * x, sense=so.MIN, name='obj2') # Overrides obj1
>>> obj3 = m.append_objective(10 * x, sense=so.MIN, name='obj3')
>>> assertEquals(m.get_all_objectives(), [obj2, obj3])
True
```

## sasoptpy.Model.add\_variable

`Model.add_variable(self, name, vartype=None, lb=None, ub=None, init=None)`

Adds a new variable to the model

New variables can be created via this method or existing variables can be added to the model.

### Parameters

- name** [string, optional] Name of the variable to be created
- vartype** [string, optional] Type of the variable, either 'BIN', 'INT' or 'CONT'
- lb** [float, optional] Lower bound of the variable
- ub** [float, optional] Upper bound of the variable
- init** [float, optional] Initial value of the variable

### Returns

- var** [Variable] Variable that is added to the model

See also:

*Variable*, *Model.include()*

## Notes

- If argument *var* is not None, then all other arguments are ignored.
- A generic variable name is generated if name argument is None.

## Examples

Adding a variable on the fly

```
>>> m = so.Model(name='demo')
>>> x = m.add_variable(name='x', vartype=so.INT, ub=10, init=2)
>>> print(repr(x))
NOTE: Initialized model demo
sasoptpy.Variable(name='x', lb=0, ub=10, init=2, vartype='INT')
```

Adding an existing variable to a model

```
>>> y = so.Variable(name='y', vartype=so.BIN)
>>> m = so.Model(name='demo')
>>> m.include(y)
```

**sasoptpy.Model.add\_variables**

`Model.add_variables` (*self*, \**argv*, *name=None*, *vartype=None*, *lb=None*, *ub=None*, *init=None*)

Adds a group of variables to the model

**Parameters**

**argv** [list, dict, `pandas.Index`] Loop index for variable group

**name** [string, optional] Name of the variables

**vartype** [string, optional] Type of variables, *BIN*, *INT*, or *CONT*

**lb** [list, dict, `pandas.Series`] Lower bounds of variables

**ub** [list, dict, `pandas.Series`] Upper bounds of variables

**init** [list, dict, `pandas.Series`] Initial values of variables

See also:

*VariableGroup*, *Model.include()*

**Notes**

If *vg* argument is passed, all other arguments are ignored.

**Examples**

```
>>> production = m.add_variables(PERIODS, vartype=so.INT,
                                name='production', lb=min_production)
>>> print(production)
>>> print(repr(production))
Variable Group (production) [
  [Period1: production['Period1',]]
  [Period2: production['Period2',]]
  [Period3: production['Period3',]]
]
sasoptpy.VariableGroup(['Period1', 'Period2', 'Period3'],
name='production')
```

**sasoptpy.Model.add\_implicit\_variable**

`Model.add_implicit_variable` (*self*, *argv=None*, *name=None*)

Adds an implicit variable to the model

**Parameters**

**argv** [Generator-type object] Generator object where each item is an entry

**name** [string, optional] Name of the implicit variable

## Notes

- Based on whether generated by a regular expression or an abstract one, implicit variables may appear in generated OPTMODEL codes.

## Examples

```
>>> x = m.add_variables(range(5), name='x')
>>> y = m.add_implicit_variable((
>>>     x[i] + 2 * x[i+1] for i in range(4)), name='y')
>>> print(y[2])
x[2] + 2 * x[3]
```

```
>>> I = m.add_set(name='I')
>>> z = m.add_implicit_variable((x[i] * 2 + 2 for i in I), name='z')
>>> print(z._defn())
impvar z {i_1 in I} = 2 * x[i_1] + 2;
```

## sasoptpy.Model.get\_variable

`Model.get_variable(self, name)`

Returns the reference to a variable in the model

### Parameters

**name** [string] Name or key of the variable requested

### Returns

**variable** [Variable] Reference to the variable

## Examples

```
>>> m.add_variable(name='x', vartype=so.INT, lb=3, ub=5)
>>> var1 = m.get_variable('x')
>>> print(repr(var1))
sasoptpy.Variable(name='x', lb=3, ub=5, vartype='INT')
```

## sasoptpy.Model.get\_variables

`Model.get_variables(self)`

Returns a list of variables

### Returns

**variables** [list] List of variables in the model

## Examples

```
>>> x = m.add_variables(2, name='x')
>>> y = m.add_variable(name='y')
>>> print(m.get_variables())
[sasoptpy.Variable(name='x_0', vartype='CONT'),
 sasoptpy.Variable(name='x_1', vartype='CONT'),
 sasoptpy.Variable(name='y', vartype='CONT')]
```

## sasoptpy.Model.get\_grouped\_variables

`Model.get_grouped_variables(self)`

Get an ordered dictionary of variables, grouped based on creation

### Returns

**grouped\_vars** [OrderedDict] Dictionary of variables and variable groups in the model

See also:

[`Model.get\_variables\(\)`](#), [`Model.get\_grouped\_constraints\(\)`](#)

## Examples

```
>>> m1 = so.Model(name='test_copy_model_1')
>>> x = m1.add_variable(name='x')
>>> y = m1.add_variables(2, name='y')
>>> vars = OrderedDict([('x', x), ('y', y)])
>>> self.assertEqual(m1.get_grouped_variables(), vars)
True
```

## sasoptpy.Model.get\_implicit\_variables

`Model.get_implicit_variables(self)`

Returns a list of implicit variables

### Returns

**implicit\_variables** [list] List of implicit variables in the model

## Examples

```
>>> m = so.Model(name='test_add_impvar')
>>> x = m.add_variables(5, name='x')
>>> y = m.add_implicit_variable((i * x[i] + x[i] ** 2 for i in range(5)),
                                name='y')
>>> assertEquals([y], m.get_implicit_variables())
True
```

### **sasoptpy.Model.get\_variable\_coef**

`Model.get_variable_coef(self, var)`

Returns the objective value coefficient of a variable

#### **Parameters**

**var** [Variable or string] Variable whose objective value is requested or its name

#### **Returns**

**coef** [float] Objective value coefficient of the given variable

#### **Examples**

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> m.set_objective(4 * x - 5 * y, name='obj', sense=so.MAX)
>>> print(m.get_variable_coef(x))
4.0
>>> print(m.get_variable_coef('y'))
-5.0
```

### **sasoptpy.Model.drop\_variable**

`Model.drop_variable(self, variable)`

Drops a variable from the model

#### **Parameters**

**variable** [Variable] The variable to be dropped from the model

**See also:**

*`Model.drop_variables()`*

*`Model.drop_constraint()`*

*`Model.drop_constraints()`*

#### **Examples**

```
>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> print(m.get_variable('x'))
x
>>> m.drop_variable(x)
>>> print(m.get_variable('x'))
None
```

**sasoptpy.Model.drop\_variables****Model.drop\_variables** (*self, variables*)

Drops a variable group from the model

**Parameters****variables** [VariableGroup] The variable group to be dropped from the model**See also:***Model.drop\_variable()**Model.drop\_constraint()**Model.drop\_constraints()***Examples**

```
>>> x = m.add_variables(3, name='x')
>>> print(m.get_variables())
[sasoptpy.Variable(name='x_0', vartype='CONT'),
 sasoptpy.Variable(name='x_1', vartype='CONT')]
>>> m.drop_variables(x)
>>> print(m.get_variables())
[]
```

**sasoptpy.Model.add\_constraint****Model.add\_constraint** (*self, c, name*)

Adds a single constraint to the model

**Parameters****c** [Constraint] Constraint to be added to the model**name** [string, optional] Name of the constraint**Returns****c** [Constraint] Reference to the constraint**See also:***Constraint, Model.include()***Examples**

```
>>> x = m.add_variable(name='x', vartype=so.INT, lb=0, ub=5)
>>> y = m.add_variables(3, name='y', vartype=so.CONT, lb=0, ub=10)
>>> c1 = m.add_constraint(x + y[0] >= 3, name='c1')
>>> print(c1)
x + y[0] >= 3
```

```
>>> c2 = m.add_constraint(x - y[2] == [4, 10], name='c2')
>>> print(c2)
- y[2] + x = [4, 10]
```

## `sasoptpy.Model.add_constraints`

`Model.add_constraints` (*self*, *argv*, *name=None*)

Adds a set of constraints to the model

### Parameters

**argv** [Generator-type object] List of constraints as a Generator-type object

**name** [string, optional] Name for the constraint group and individual constraint prefix

### Returns

**cg** [ConstraintGroup] Reference to the ConstraintGroup

See also:

[\*ConstraintGroup\*](#), [\*Model.include\(\)\*](#)

## Examples

```
>>> x = m.add_variable(name='x', vartype=so.INT, lb=0, ub=5)
>>> y = m.add_variables(3, name='y', vartype=so.CONT, lb=0, ub=10)
>>> c = m.add_constraints((x + 2 * y[i] >= 2 for i in [0, 1, 2]),
                        name='c')
>>> print(c)
Constraint Group (c) [
  [0:  2.0 * y[0] + x >= 2]
  [1:  2.0 * y[1] + x >= 2]
  [2:  2.0 * y[2] + x >= 2]
]
```

```
>>> t = m.add_variables(3, 4, name='t')
>>> ct = m.add_constraints((t[i, j] <= x for i in range(3)
                        for j in range(4)), name='ct')
>>> print(ct)
Constraint Group (ct) [
  [(0, 0): - x + t[0, 0] <= 0]
  [(0, 1): t[0, 1] - x <= 0]
  [(0, 2): - x + t[0, 2] <= 0]
  [(0, 3): t[0, 3] - x <= 0]
  [(1, 0): t[1, 0] - x <= 0]
  [(1, 1): t[1, 1] - x <= 0]
  [(1, 2): - x + t[1, 2] <= 0]
  [(1, 3): - x + t[1, 3] <= 0]
  [(2, 0): - x + t[2, 0] <= 0]
  [(2, 1): t[2, 1] - x <= 0]
  [(2, 2): t[2, 2] - x <= 0]
  [(2, 3): t[2, 3] - x <= 0]
]
```

## sasoptpy.Model.get\_constraint

`Model.get_constraint(self, name)`

Returns the reference to a constraint in the model

### Parameters

**name** [string] Name of the constraint requested

### Returns

**constraint** [Constraint] Reference to the constraint

### Examples

```
>>> m.add_constraint(2 * x + y <= 15, name='c1')
>>> print(m.get_constraint('c1'))
2.0 * x + y <= 15
```

## sasoptpy.Model.get\_constraints

`Model.get_constraints(self)`

Returns a list of constraints in the model

### Returns

**constraints** [list] A list of Constraint objects

### Examples

```
>>> m.add_constraint(x[0] + y <= 15, name='c1')
>>> m.add_constraints((2 * x[i] - y >= 1 for i in [0, 1]), name='c2')
>>> print(m.get_constraints())
[sasoptpy.Constraint( x[0] + y <= 15, name='c1'),
 sasoptpy.Constraint( 2.0 * x[0] - y >= 1, name='c2_0'),
 sasoptpy.Constraint( 2.0 * x[1] - y >= 1, name='c2_1')]
```

## sasoptpy.Model.get\_grouped\_constraints

`Model.get_grouped_constraints(self)`

Get an ordered dictionary of constraints, grouped based on creation

### Returns

**grouped\_cons** [OrderedDict] Dictionary of constraints and constraint groups in the model

See also:

`Model.get_constraints()`, `Model.get_grouped_variables()`

## Examples

```
>>> m1 = so.Model(name='test_copy_model_1')
>>> x = m1.add_variable(name='x')
>>> y = m1.add_variables(2, name='y')
>>> c1 = m1.add_constraint(x + y[0] >= 2, name='c1')
>>> c2 = m1.add_constraints((x - y[i] <= 10 for i in range(2)), name='c2')
>>> cons = OrderedDict([('c1', c1), ('c2', c2)])
>>> self.assertEqual(m1.get_grouped_constraints(), cons)
True
```

## `sasoptpy.Model.drop_constraint`

`Model.drop_constraint` (*self*, *constraint*)

Drops a constraint from the model

### Parameters

**constraint** [Constraint] The constraint to be dropped from the model

See also:

`Model.drop_constraints()`

`Model.drop_variable()`

`Model.drop_variables()`

## Examples

```
>>> c1 = m.add_constraint(2 * x + y <= 15, name='c1')
>>> print(m.get_constraint('c1'))
2 * x + y <= 15
>>> m.drop_constraint(c1)
>>> print(m.get_constraint('c1'))
None
```

## `sasoptpy.Model.drop_constraints`

`Model.drop_constraints` (*self*, *constraints*)

Drops a constraint group from the model

### Parameters

**constraints** [ConstraintGroup] The constraint group to be dropped from the model

See also:

`Model.drop_constraints()`

`Model.drop_variable()`

`Model.drop_variables()`

## Examples

```
>>> c1 = m.add_constraints((x[i] + y <= 15 for i in [0, 1]), name='c1')
>>> print(m.get_constraints())
[sasoptpy.Constraint( x[0] + y <= 15, name='c1_0'),
 sasoptpy.Constraint( x[1] + y <= 15, name='c1_1')]
>>> m.drop_constraints(c1)
>>> print(m.get_constraints())
[]
```

## sasoptpy.Model.add\_set

`Model.add_set` (*self*, *name*, *init=None*, *value=None*, *settype=None*)

Adds a set to the model

### Parameters

**name** [string, optional] Name of the set

**init** [Set, optional] Initial value of the set

**value** [list, float, optional] Exact value of the set

**settype** [list, optional] Types of the set, a list consists of ‘num’ and ‘str’ values

## Examples

```
>>> I = m.add_set(name='I')
>>> print(I._defn())
set I;
```

```
>>> J = m.add_set(name='J', settype=['str'])
>>> print(J._defn())
set <str> J;
```

```
>>> N = m.add_parameter(name='N', init=4)
>>> K = m.add_set(name='K', init=so.exp_range(1, N))
>>> print(K._defn())
set K = 1..N;
```

## sasoptpy.Model.add\_parameter

`Model.add_parameter` (*self*, *\*argv*, *name=None*, *init=None*, *value=None*, *p\_type=None*)

Adds a parameter to the model

### Parameters

**argv** [Set, optional] Key set of the parameter

**name** [string, optional] Name of the parameter

**init** [float or expression, optional] Initial value of the parameter

**p\_type** [string, optional] Type of the parameter, ‘num’ for floats or ‘str’ for strings

## Examples

```
>>> I = m.add_set(name='I')
>>> a = m.add_parameter(I, name='a', init=5)
>>> print(a._defn())
num a {I} init 5 ;
```

## sasoptpy.Model.add\_statement

`Model.add_statement` (*self*, *statement*, *after\_solve=None*)

Adds a PROC OPTMODEL statement to the model

### Parameters

**statement** [Expression or string] Statement object

### Notes

- If the statement string includes ‘print’, then it is automatically placed after solve.
- The first parameter, *statement* could be a Statement object when internally used.

## Examples

```
>>> I = m.add_set(name='I')
>>> x = m.add_variables(I, name='x', vartype=so.INT)
>>> a = m.add_parameter(I, name='a')
>>> c = m.add_constraints((x[i] <= 2 * a[i] for i in I), name='c')
>>> m.add_statement('print x;', after_solve=True)
>>> print(m.to_optmodel())
proc optmodel;
min m_obj = 0;
set I;
var x {I} integer >= 0;
num a {I};
con c {i_1 in I} : x[i_1] - 2.0 * a[i_1] <= 0;
solve;
print _var_.name _var_.lb _var_.ub _var_.rc;
print _con_.name _con_.body _con_.dual;
print x;
quit;
```

## sasoptpy.Model.get\_sets

`Model.get_sets` (*self*)

Returns a list of Set objects in the model

### sasoptpy.Model.get\_parameters

`Model.get_parameters(self)`

Returns a list of `Parameter` objects in the model

### sasoptpy.Model.get\_statements

`Model.get_statements(self)`

Returns a list of all abstract statements inside the model.

### sasoptpy.Model.include

`Model.include(self, *argv)`

Adds existing variables and constraints to a model

#### Parameters

**argv** : Objects to be included in the model

#### Notes

- Valid argument types:
  - `Model`
  - `Variable`
  - `Constraint`
  - `VariableGroup`
  - `ConstraintGroup`
  - `Objective`
  - `Set`
  - `Parameter`
  - `ParameterGroup`
  - `Statement` and all subclasses
  - `ImplicitVar`
- Including a model causes all variables and constraints inside the original model to be included.

#### Examples

Adding an existing variable

```
>>> x = so.Variable(name='x', vartype=so.CONT)
>>> m.include(x)
```

Adding an existing constraint

```
>>> c1 = so.Constraint(x + y <= 5, name='c1')
>>> m.include(c1)
```

Adding an existing set of variables

```
>>> z = so.VariableGroup(3, 5, name='z', ub=10)
>>> m.include(z)
```

Adding an existing set of constraints

```
>>> c2 = so.ConstraintGroup((x + 2 * z[i, j] >= 2 for i in range(3)
                             for j in range(5)), name='c2')
>>> m.include(c2)
```

Adding an existing model (including all of its elements)

```
>>> new_model = so.Model(name='new_model')
>>> new_model.include(m)
```

## Solver calls

<code>Model.solve(self, **kwargs)</code>	Solves the model by calling CAS or SAS optimization solvers
<code>Model.tune_parameters(self, **kwargs)</code>	Uses model tuner to find ideal parameters for given model
<code>Model.get_solution(self[, vtype, solution, ...])</code>	Returns the solution details associated with the primal or dual solution
<code>Model.get_variable_value(self, var)</code>	Returns the value of a variable.
<code>Model.get_objective_value(self)</code>	Returns the optimal objective value, if it exists
<code>Model.get_solution_summary(self)</code>	Returns the solution summary table to the user
<code>Model.get_problem_summary(self)</code>	Returns the problem summary table to the user
<code>Model.get_tuner_results(self)</code>	Returns the tuner responses for the model
<code>Model.print_solution(self)</code>	Prints the current values of the variables
<code>Model.clear_solution(self)</code>	Clears the cached solution of the model

## sasoptpy.Model.solve

`Model.solve(self, **kwargs)`

Solves the model by calling CAS or SAS optimization solvers

### Parameters

- options** [dict, optional] A dictionary solver options
- submit** [boolean, optional] Switch for calling the solver instantly
- name** [string, optional] Name of the table name
- frame** [boolean, optional] Switch for uploading problem as a MPS DataFrame format
- drop** [boolean, optional] Switch for dropping the MPS table after solve (only CAS)
- replace** [boolean, optional] Switch for replacing an existing MPS table (only CAS and MPS)
- primalin** [boolean, optional] Switch for using initial values (only MILP)
- verbose** [boolean, optional (experimental)] Switch for printing generated OPTMODEL code

### Returns

**solution** [`pandas.DataFrame`] Solution of the optimization model

See also:

`Model.solve_on_cas()`, `Model.solve_on_mva()`

## Notes

- This method is essentially a wrapper for two other methods.
- Some of the options listed under `options` argument may not be passed based on which CAS Action is being used.
- The `option` argument should be a dictionary, where keys are option names. For example, `m.solve(options={'maxtime': 600})` limits the solution time to 600 seconds.
- See *Solver Options* for a list of solver options.

## Examples

```
>>> m.solve()
NOTE: Initialized model food_manufacture_1
NOTE: Converting model food_manufacture_1 to DataFrame
NOTE: Added action set 'optimization'.
...
NOTE: Optimal.
NOTE: Objective = 107842.59259.
NOTE: The Dual Simplex solve time is 0.01 seconds.
```

```
>>> m.solve(options={'maxtime': 600})
```

```
>>> m.solve(options={'algorithm': 'ipm'})
```

## `sasoptpy.Model.tune_parameters`

`Model.tune_parameters(self, **kwargs)`

Uses model tuner to find ideal parameters for given model

### Parameters

**kwargs** : Keyword arguments as defined in the `optimization.tuner` action Acceptable values are:

- `milpParameters` : Parameters for the `solveMilp` action, such as *maxTime*, *heuristics*, *feasTol*
- `tunerParameters` : Parameters for tuner itself, such as *maxConfigs*, *printLevel*, *logFreq*
- `tuningParameters` : List of parameters to be tuned, such as *cutStrategy*, *presolver*, *restarts*

### Returns

**tunerResults** [`swat.dataframe.SASDataFrame`] Results of tuner as a table

See also:

`Model.get_tuner_results()`

## Notes

- See SAS Optimization documentation for a full list of tunable parameters: <https://go.documentation.sas.com/?docsetId=casactmopt&docsetTarget=cas-optimization-tuner.htm&docsetVersion=8.5&locale=en#PYTHON.cas-optimization-tuner-tunerparameters>
- See full documentation at: [https://go.documentation.sas.com/?docsetId=casactmopt&docsetTarget=casactmopt\\_optimization\\_details35.htm&docsetVersion=8.5&locale=en](https://go.documentation.sas.com/?docsetId=casactmopt&docsetTarget=casactmopt_optimization_details35.htm&docsetVersion=8.5&locale=en)

## Examples

```
>>> m = so.Model(name='model11')
>>> ...
>>> results = m.tune_parameters(tunerParameters={'maxConfigs': 10})
NOTE: Initialized model knapsack_with_tuner.
NOTE: Added action set 'optimization'.
NOTE: Uploading the problem DataFrame to the server.
NOTE: Cloud Analytic Services made the uploaded file available as table KNAPSACK_
↪WITH_TUNER in caslib CASUSER(casuser).
NOTE: The table KNAPSACK_WITH_TUNER has been created in caslib CASUSER(casuser)
↪from binary data uploaded to Cloud Analytic Services.

13               13.0      aggressive  ...          0.17          100.0
14               14.0      automatic  ...          0.17          100.0
15               15.0              none  ...          0.17          100.0
16               16.0              none  ...          0.17          100.0
17               17.0      moderate  ...          0.17          100.0
18               18.0      moderate  ...          0.17          100.0
19               19.0              none  ...          0.17          100.0

```

## sasoptpy.Model.get\_solution

`Model.get_solution(self, vtype='Primal', solution=None, pivot=False)`

Returns the solution details associated with the primal or dual solution

### Parameters

**vtype** [string, optional] 'Primal' or 'Dual'

**solution** [integer, optional] Solution number to be returned (for MILP)

**pivot** [boolean, optional] Switch for returning multiple solutions in columns as a pivot table

### Returns

**solution** [pandas.DataFrame] Primal or dual solution table returned from the CAS Action

## Notes

- If `Model.solve()` method is used with `frame=True` option, MILP solver returns multiple solutions. You can obtain different results using `solution` parameter.

## Examples

```
>>> m.solve()
>>> print(m.get_solution('Primal'))
```

	var	lb	ub	value	solution
0	x[clock]	0.0	1.797693e+308	0.0	1.0
1	x[pc]	0.0	1.797693e+308	5.0	1.0
2	x[headphone]	0.0	1.797693e+308	2.0	1.0
3	x[mug]	0.0	1.797693e+308	0.0	1.0
4	x[book]	0.0	1.797693e+308	0.0	1.0

```

### sasoptpy.Model.get\_variable\_value

`Model.get_variable_value(self, var)`

Returns the value of a variable.

#### Parameters

**var** [Variable or string] Variable reference

#### Notes

- It is possible to get a variable's value by using the `Variable.get_value()` method, if the variable is not abstract.
- This method is a wrapper around `Variable.get_value()` and an overlook function for model components

### sasoptpy.Model.get\_objective\_value

`Model.get_objective_value(self)`

Returns the optimal objective value, if it exists

#### Returns

**objective\_value** [float] Objective value at current solution

## Notes

- This method should be used for getting the objective value after solve. Using `m.get_objective().get_value()` actually evaluates the expression using optimal variable values. This may not be available for nonlinear expressions.

## Examples

```
>>> m.solve()
>>> print(m.get_objective_value())
42.0
```

## `sasoptpy.Model.get_solution_summary`

`Model.get_solution_summary(self)`

Returns the solution summary table to the user

### Returns

`ss [swat.dataframe.SASDataFrame]` Solution summary obtained after solve

## Examples

```
>>> m.solve()
>>> soln = m.get_solution_summary()
>>> print(type(soln))
<class 'swat.dataframe.SASDataFrame'>
```

```
>>> print(soln)
Solution Summary

```

Label	Value
Solver	LP
Algorithm	Dual Simplex
Objective Function	obj
Solution Status	Optimal
Objective Value	10
Primal Infeasibility	0
Dual Infeasibility	0
Bound Infeasibility	0
Iterations	2
Presolve Time	0.00
Solution Time	0.01

```
>>> print(soln.index)
Index(['Solver', 'Algorithm', 'Objective Function', 'Solution Status',
      'Objective Value', '', 'Primal Infeasibility',
      'Dual Infeasibility', 'Bound Infeasibility', '', 'Iterations',
      'Presolve Time', 'Solution Time'],
      dtype='object', name='Label')
```

```
>>> print(soln.loc['Solution Status', 'Value'])
Optimal
```

**sasoptpy.Model.get\_problem\_summary****Model.get\_problem\_summary** (*self*)

Returns the problem summary table to the user

**Returns****ps** [swat.dataframe.SASDataFrame] Problem summary obtained after *Model.solve()***Examples**

```
>>> m.solve()
>>> ps = m.get_problem_summary()
>>> print(type(ps))
<class 'swat.dataframe.SASDataFrame'>
```

```
>>> print(ps)
Problem Summary
                                Value
Label
Problem Name                    modell
Objective Sense                Maximization
Objective Function                obj
RHS                             RHS
Number of Variables                2
Bounded Above                    0
Bounded Below                    2
Bounded Above and Below          0
Free                             0
Fixed                             0
Number of Constraints            2
LE (<=)                          1
EQ (=)                           0
GE (>=)                          1
Range                            0
Constraint Coefficients          4
```

```
>>> print(ps.index)
Index(['Problem Name', 'Objective Sense', 'Objective Function', 'RHS',
      '', 'Number of Variables', 'Bounded Above', 'Bounded Below',
      'Bounded Above and Below', 'Free', 'Fixed', '',
      'Number of Constraints', 'LE (<=)', 'EQ (=)', 'GE (>=)', 'Range', '',
      'Constraint Coefficients'],
      dtype='object', name='Label')
```

```
>>> print(ps.loc['Number of Variables'])
Value                2
Name: Number of Variables, dtype: object
```

```
>>> print(ps.loc['Constraint Coefficients', 'Value'])
4
```

### **sasoptpy.Model.get\_tuner\_results**

`Model.get_tuner_results(self)`

Returns the tuner responses for the model

#### **Returns**

**tunerResults** [dict] Returns tuner results as a dictionary. Its members are - Performance Information - Tuner Information - Tuner Summary - Tuner Results

**See also:**

*`Model.tune_parameters()`*

#### **Examples**

```
>>> m.tune_parameters(tunerParameters={'maxConfigs': 10})
>>> results = m.get_tuner_results()
```

### **sasoptpy.Model.print\_solution**

`Model.print_solution(self)`

Prints the current values of the variables

**See also:**

*`Model.get_solution()`*

#### **Notes**

- This function may not work for abstract variables and nonlinear models.

#### **Examples**

```
>>> m.solve()
>>> m.print_solution()
x: 2.0
y: 0.0
```

### **sasoptpy.Model.clear\_solution**

`Model.clear_solution(self)`

Clears the cached solution of the model

## Notes

- This method only cleans model's own parameters, not its components'

## Export

---

```
Model.to_mps(self, \*\*kwargs)
```

---

```
Model.to_optmodel(self, \*\*kwargs)
```

---

## sasoptpy.Model.to\_mps

```
Model.to_mps (self, **kwargs)
```

## sasoptpy.Model.to\_optmodel

```
Model.to_optmodel (self, **kwargs)
```

## Internal functions

---

```
Model._is_linear(self)
```

---

Checks if the model can be written as a linear model (in MPS format)

---

## sasoptpy.Model.\_is\_linear

```
Model._is_linear (self)
```

Checks if the model can be written as a linear model (in MPS format)

### Returns

**is\_linear** [boolean] True if model does not have any nonlinear components or abstract operations, False otherwise

## Deprecated

Deprecated since version 1.0.0.

The following method(s) are deprecated and will be removed in future minor updates.

---

```
Model.to_frame(self, \*\*kwargs)
```

---

## sasoptpy.Model.to\_frame

`Model.to_frame(self, **kwargs)`

## 5.1.2 Expression

### Constructor

<code>Expression([exp, name])</code>	Creates a mathematical expression to represent model components
<code>Auxiliary(base[, prefix, suffix, operator, ...])</code>	Represents an auxiliary expression, often as a symbolic attribute
<code>Symbol(name)</code>	Represents a symbolic string, to be evaluated on server-side

## sasoptpy.Expression

**class Expression** (*exp=None, name=None*)

Bases: `object`

Creates a mathematical expression to represent model components

#### Parameters

- exp** [Expression, optional] An existing expression where arguments are being passed
- name** [string, optional] A local name for the expression
- temp** [boolean, optional] A boolean shows whether expression is temporary or permanent

### Notes

- Two other classes (*Variable* and *Constraint*) are subclasses of this class.
- Expressions are created automatically after linear math operations with variables.
- An expression object can be called when defining constraints and other expressions.

### Examples

```
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(3, name='y')
>>> e = so.Expression(exp=x + 3 * y[0] - 5 * y[1], name='exp1')
>>> print(e)
- 5.0 * y[1] + 3.0 * y[0] + x
>>> print(repr(e))
sasoptpy.Expression(exp = - 5.0 * y[1] + 3.0 * y[0] + x ,
                    name='exp1')
```

```
>>> sales = so.Variable(name='sales')
>>> material = so.Variable(name='material')
>>> profit = 5 * sales - 3 * material
```

(continues on next page)

(continued from previous page)

```
>>> print(profit)
5.0 * sales - 3.0 * material
>>> print(repr(profit))
sasoptpy.Expression(exp = 5.0 * sales - 3.0 * material , name=None)
```

```
>>> import sasoptpy.abstract.math as sm
>>> f = sm.sin(x) + sm.min(y[1],1) ** 2
>>> print(type(f))
<class 'sasoptpy.core.Expression'>
>>> print(f)
sin(x) + (min(y[1] , 1)) ** (2)
```

## sasoptpy.Auxiliary

**class Auxiliary** (*base, prefix=None, suffix=None, operator=None, value=None*)

Bases: `sasoptpy.core.expression.Expression`

Represents an auxiliary expression, often as a symbolic attribute

### Parameters

- base** [*Expression*] Original owner of the auxiliary value
- prefix** [string, optional] Prefix of the expression
- suffix** [string, optional] Suffix of the expression
- operator** [string, optional] Wrapping operator
- value** [float, optional] Initial value of the symbolic object

### Notes

- Auxiliary objects are for internal use

## sasoptpy.Symbol

**class Symbol** (*name*)

Bases: `sasoptpy.core.expression.Expression`

Represents a symbolic string, to be evaluated on server-side

### Parameters

- name** [string] String to be symbolized

## Notes

- Symbol objects can be used for values that does not translate to a value on client-side, but have meaning on execution. For example, `_N_` is a SAS symbol, which can be used in OPTMODEL strings.

## General methods

<code>Expression.set_name(self[, name])</code>	Sets the name of the expression
<code>Expression.set_permanent(self)</code>	Converts a temporary expression into a permanent one
<code>Expression.set_temporary(self)</code>	Converts expression into temporary to enable in-place operations
<code>Expression.get_name(self)</code>	Returns the name of the expression
<code>Expression.get_value(self)</code>	Calculates and returns the value of the linear expression
<code>Expression.get_dual(self)</code>	Returns the dual value if exists

## `sasoptpy.Expression.set_name`

`Expression.set_name(self, name=None)`

Sets the name of the expression

### Parameters

**name** [string] Name of the expression

### Returns

**name** [string] Name of the expression after resolving conflicts

## Examples

```
>>> x = so.Variable(name='x')
>>> e = x**2 + 2*x + 1
>>> e.set_name('expansion')
```

## `sasoptpy.Expression.set_permanent`

`Expression.set_permanent(self)`

Converts a temporary expression into a permanent one

### Parameters

**name** [string, optional] Name of the expression

### Returns

**name** [string] Name of the expression in the namespace

### **sasoptpy.Expression.set\_temporary**

`Expression.set_temporary(self)`

Converts expression into temporary to enable in-place operations

### **sasoptpy.Expression.get\_name**

`Expression.get_name(self)`

Returns the name of the expression

#### **Returns**

**name** [string] Name of the expression

#### **Examples**

```
>>> m = so.Model()
>>> var1 = m.add_variables(name='x')
>>> print(var1.get_name())
x
```

### **sasoptpy.Expression.get\_value**

`Expression.get_value(self)`

Calculates and returns the value of the linear expression

#### **Returns**

**v** [float] Value of the expression

#### **Examples**

```
>>> sales = so.Variable(name='sales', init=10)
>>> material = so.Variable(name='material', init=3)
>>> profit = so.Expression(5 * sales - 3 * material)
>>> print(profit.get_value())
41
```

### **sasoptpy.Expression.get\_dual**

`Expression.get_dual(self)`

Returns the dual value if exists

#### **Returns**

**dual** [float] Dual value of the variable

## Operations

<code>Expression.add(self, other[, sign])</code>	Combines two expressions and produces a new one
<code>Expression.copy(self[, name])</code>	Returns a copy of the <i>Expression</i> object
<code>Expression.mult(self, other)</code>	Multiplies the <i>Expression</i> with a scalar value
<code>Expression.get_member(self, key)</code>	Returns the requested member using the key
<code>Expression.get_member_dict(self)</code>	Returns an ordered dictionary of elements
<code>Expression.get_member_value(self, key)</code>	Returns coefficient of requested member
<code>Expression.get_constant(self)</code>	Returns the constant term in the expression
<code>Expression.set_member(self, key, ref, val[, op])</code>	Adds a new member or changes an existing member
<code>Expression.set_member_value(self, key, value)</code>	Changes the coefficient of the requested member
<code>Expression.add_to_member_value(self, key, value)</code>	Adds given value to the coefficient of the requested member
<code>Expression.mult_member_value(self, key, value)</code>	Multiplies coefficient of the requested member with given value
<code>Expression.copy_member(self, key, exp)</code>	Copies member of another expression
<code>Expression.delete_member(self, key)</code>	Deletes the requested member from the core dictionary

### sasoptpy.Expression.add

`Expression.add(self, other, sign=1)`

Combines two expressions and produces a new one

#### Parameters

**other** [float or Expression] Second expression or constant value to be added

**sign** [int, optional] Sign of the addition, 1 or -1

#### Returns

**r** [Expression] Reference to the outcome of the operation

#### Notes

- Adding an expression is equivalent to calling this method:  $(x-y)+(3*x-2*y)$  and  $(x-y).add(3*x-2*y)$  result the same.

### sasoptpy.Expression.copy

`Expression.copy(self, name=None)`

Returns a copy of the *Expression* object

#### Parameters

**name** [string, optional] Name for the copy

#### Returns

**r** [Expression] Copy of the object

## Examples

```
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(1, name='y')
>>> e = so.Expression(7 * x - y[0], name='e')
>>> print(repr(e))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='e')
>>> f = e.copy(name='f')
>>> print(repr(f))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='f')
```

## sasoptpy.Expression.mult

`Expression.mult(self, other)`

Multiplies the *Expression* with a scalar value

### Parameters

**other** [Expression or int] Second expression to be multiplied

### Returns

**r** [Expression] A new *Expression* that represents the multiplication

## Notes

- This method is mainly for internal use.
- Multiplying an expression is equivalent to calling this method:  $3*(x-y)$  and  $(x-y).mult(3)$  are interchangeable.

## sasoptpy.Expression.get\_member

`Expression.get_member(self, key)`

Returns the requested member using the key

### Parameters

**key** [string] Identifier of the member, name for single objects

### Returns

**member** [dict] A dictionary of coefficient, operator, and reference of member

## sasoptpy.Expression.get\_member\_dict

`Expression.get_member_dict(self)`

Returns an ordered dictionary of elements

### **sasoptpy.Expression.get\_member\_value**

`Expression.get_member_value(self, key)`

Returns coefficient of requested member

#### **Parameters**

**key** [string] Identifier of the member

#### **Returns**

**value** [float] Coefficient value of the requested member

### **sasoptpy.Expression.get\_constant**

`Expression.get_constant(self)`

Returns the constant term in the expression

#### **Examples**

```
>>> x = so.Variable(name='x')
>>> e = 2 * x + 5
>>> print(e.get_constant())
5
```

### **sasoptpy.Expression.set\_member**

`Expression.set_member(self, key, ref, val, op=None)`

Adds a new member or changes an existing member

#### **Parameters**

**key** [string] Identifier of the member

**ref** [Object] A reference to the new member

**val** [float] Initial coefficient of the element

**op** [string, optional] Operator, if member consists of multiple children

### **sasoptpy.Expression.set\_member\_value**

`Expression.set_member_value(self, key, value)`

Changes the coefficient of the requested member

#### **Parameters**

**key** [string] Identifier of the member

**value** [float] New coefficient value of the member

**sasoptpy.Expression.add\_to\_member\_value**

`Expression.add_to_member_value` (*self*, *key*, *value*)  
Adds given value to the coefficient of the requested member

**Parameters**

**key** [string] Identifier of the member  
**value** [float] Value to be added

**sasoptpy.Expression.mult\_member\_value**

`Expression.mult_member_value` (*self*, *key*, *value*)  
Multiplies coefficient of the requested member with given value

**Parameters**

**key** [string] Identifier of the member  
**value** [float] Value to be multiplied with

**sasoptpy.Expression.copy\_member**

`Expression.copy_member` (*self*, *key*, *exp*)  
Copies member of another expression

**Parameters**

**key** [string] Identifier of the member  
**exp** [*Expression*] Other expression to be copied from

**sasoptpy.Expression.delete\_member**

`Expression.delete_member` (*self*, *key*)  
Deletes the requested member from the core dictionary

**Class methods**

---

`Expression.to_expression`(obj)

---

## `sasoptpy.Expression.to_expression`

**classmethod** `Expression.to_expression(obj)`

### Private Methods

<code>Expression._expr(self)</code>	Generates the OPTMODEL compatible string representation of the object.
<code>Expression._is_linear(self)</code>	Checks if the expression is composed of linear components
<code>Expression._relational(self, other, direction_)</code>	Creates a logical relation between <i>Expression</i> objects
<code>Expression.__repr__(self)</code>	Returns a string representation of the object.
<code>Expression.__str__(self)</code>	Generates a representation string that is Python compatible

## `sasoptpy.Expression._expr`

`Expression._expr(self)`  
Generates the OPTMODEL compatible string representation of the object.

### Examples

```
>>> x = so.Variable(name='x')
>>> y = so.Variable(name='y')
>>> f = x + y ** 2
>>> print(f)
x + (y) ** (2)
>>> print(f._expr())
x + (y) ^ (2)
```

## `sasoptpy.Expression._is_linear`

`Expression._is_linear(self)`  
Checks if the expression is composed of linear components

### Returns

**is\_linear** [boolean] True if the expression is linear, False otherwise

## Examples

```
>>> x = so.Variable()
>>> e = x*x
>>> print(e.is_linear())
False
```

```
>>> f = x*x + x*x - 2*x*x + 5
>>> print(f.is_linear())
True
```

## sasoptpy.Expression.\_relational

Expression.**\_relational** (*self*, *other*, *direction\_*)  
Creates a logical relation between *Expression* objects

### Parameters

- other** [Expression] Expression on the other side of the relation wrt self
- direction\_** [string] Direction of the logical relation, either 'E', 'L', or 'G'

### Returns

**generated\_constraint** [Constraint] Constraint generated as a result of linear relation

## sasoptpy.Expression.\_\_repr\_\_

Expression.**\_\_repr\_\_** (*self*)  
Returns a string representation of the object.

## Examples

```
>>> x = so.Variable(name='x')
>>> y = so.Variable(name='y')
>>> f = x + y ** 2
>>> print(repr(f))
sasoptpy.Expression(exp = x + (y) ** (2), name=None)
```

## sasoptpy.Expression.\_\_str\_\_

Expression.**\_\_str\_\_** (*self*)  
Generates a representation string that is Python compatible

## Examples

```
>>> f = x + y ** 2
>>> print(str(f))
x + (y) ** (2)
```

### 5.1.3 Variable

#### Constructor

---

<code>Objective(**kwargs)</code>	Objective represents expressions with sense and used as target value in optimization
----------------------------------	--------------------------------------------------------------------------------------

---

#### `sasoptpy.Objective`

**class Objective** (*\*\*kwargs*)

Bases: `sasoptpy.core.expression.Expression`

Objective represents expressions with sense and used as target value in optimization

##### Parameters

**exp** [*Expression*] Objective as an expression

**name** [string] Unique name of the expression

**sense** [string, optional] Direction of the objective, `sasoptpy.MIN` (default) or `sasoptpy.MAX`

## Examples

```
>>> m = so.Model(name='test_objective')
>>> x = m.add_variable(name='x')
>>> obj = m.set_objective(2 * x - x ** 3, sense=so.MIN, name='new_obj')
>>> str(m.get_objective())
2 * x - (x) ** (3)
>>> type(obj)
sasoptpy.Objective
```

#### Methods

---

<code>Objective.set_sense(self, sense)</code>	Sets the objective sense (direction)
<code>Objective.get_sense(self)</code>	Returns the objective sense (direction)

---

**sasoptpy.Objective.set\_sense**

`Objective.set_sense(self, sense)`  
Sets the objective sense (direction)

**Parameters**

**sense** [string] sasoptpy.MIN or sasoptpy.MAX

**sasoptpy.Objective.get\_sense**

`Objective.get_sense(self)`  
Returns the objective sense (direction)

**5.1.4 Variable****Constructor**

---

<code>Variable(**kwargs)</code>	Creates an optimization variable to be used inside models
---------------------------------	-----------------------------------------------------------

---

**sasoptpy.Variable**

**class Variable** (*\*\*kwargs*)  
Bases: `sasoptpy.core.expression.Expression`  
Creates an optimization variable to be used inside models

**Parameters**

**name** [string] Name of the variable

**vartype** [string, optional] Type of the variable, default is continuous

**lb** [float, optional] Lower bound of the variable, default is -inf

**ub** [float, optional] Upper bound of the variable, default is inf

**init** [float, optional] Initial value of the variable

**abstract** [boolean, optional] Indicator of whether the variable is abstract or not

**shadow** [boolean, optional] Indicator of whether the variable is shadow or not Used for internal purposes

See also:

`sasoptpy.Model.add_variable()`

## Examples

```
>>> x = so.Variable(name='x', lb=0, ub=20, vartype=so.CONT)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=0, ub=20, vartype='CONT')
```

```
>>> y = so.Variable(name='y', init=1, vartype=so.INT)
>>> print(repr(y))
sasoptpy.Variable(name='y', lb=0, ub=inf, init=1, vartype='INT')
```

## Attributes

**lb** Lower bound of the variable

**ub** Upper bound of the variable

## Attributes

<code>Variable.lb</code>	Lower bound of the variable
<code>Variable.ub</code>	Upper bound of the variable

## `sasoptpy.Variable.lb`

**property** `Variable.lb`  
Lower bound of the variable

## `sasoptpy.Variable.ub`

**property** `Variable.ub`  
Upper bound of the variable

## Methods

<code>Variable.set_bounds(self, \*[, lb, ub])</code>	Changes bounds on a variable
<code>Variable.set_init(self[, init])</code>	Changes initial value of a variable
<code>Variable.get_type(self)</code>	Returns the type of variable, valid values are:
<code>Variable.get_attributes(self)</code>	Returns an OrderedDict of main attributes

## `sasoptpy.Variable.set_bounds`

`Variable.set_bounds(self, *, lb=None, ub=None)`  
Changes bounds on a variable

### Parameters

**lb** [float or *Expression*] Lower bound of the variable

**ub** [float or *Expression*] Upper bound of the variable

## Examples

```
>>> x = so.Variable(name='x', lb=0, ub=20)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=0, ub=20, vartype='CONT')
>>> x.set_bounds(lb=5, ub=15)
>>> print(repr(x))
sasoptpy.Variable(name='x', lb=5, ub=15, vartype='CONT')
```

## sasoptpy.Variable.set\_init

`Variable.set_init(self, init=None)`

Changes initial value of a variable

### Parameters

**init** [float or None] Initial value of the variable

## Examples

```
>>> x = so.Variable(name='x')
>>> x.set_init(5)

>>> y = so.Variable(name='y', init=3)
>>> y.set_init()
```

## sasoptpy.Variable.get\_type

`Variable.get_type(self)`

Returns the type of variable, valid values are:

- `sasoptpy.CONT`
- `sasoptpy.INT`
- `sasoptpy.BIN`

## sasoptpy.Variable.get\_attributes

`Variable.get_attributes(self)`

Returns an `OrderedDict` of main attributes

### Returns

**attributes** [dict] `OrderedDict` consists of *init*, *lb*, and *ub* attributes

## Inherited Methods

<code>Variable.copy(self[, name])</code>	Returns a copy of the <i>Expression</i> object
<code>Variable.get_dual(self)</code>	Returns the dual value if exists
<code>Variable.get_name(self)</code>	Returns the name of the expression
<code>Variable.get_value(self)</code>	Returns value of a variable

## sasoptpy.Variable.copy

`Variable.copy(self, name=None)`

Returns a copy of the *Expression* object

### Parameters

**name** [string, optional] Name for the copy

### Returns

**r** [Expression] Copy of the object

## Examples

```
>>> x = so.Variable(name='x')
>>> y = so.VariableGroup(1, name='y')
>>> e = so.Expression(7 * x - y[0], name='e')
>>> print(repr(e))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='e')
>>> f = e.copy(name='f')
>>> print(repr(f))
sasoptpy.Expression(exp = - y[0] + 7.0 * x , name='f')
```

## sasoptpy.Variable.get\_dual

`Variable.get_dual(self)`

Returns the dual value if exists

### Returns

**dual** [float] Dual value of the variable

## sasoptpy.Variable.get\_name

`Variable.get_name(self)`

Returns the name of the expression

### Returns

**name** [string] Name of the expression

## Examples

```
>>> m = so.Model()
>>> var1 = m.add_variables(name='x')
>>> print(var1.get_name())
x
```

### sasoptpy.Variable.get\_value

`Variable.get_value(self)`  
Returns value of a variable

## 5.1.5 Variable Group

### Constructor

---

<code>VariableGroup(**kwargs)</code>	Creates a group of <i>Variable</i> objects
--------------------------------------	--------------------------------------------

---

### sasoptpy.VariableGroup

**class** `VariableGroup(**kwargs)`  
Bases: `sasoptpy.core.group.Group`  
Creates a group of *Variable* objects

#### Parameters

**argv** [list, dict, int, `pandas.Index`] Loop index for variable group  
**name** [string, optional] Name (prefix) of the variables  
**vartype** [string, optional] Type of variables, *BIN*, *INT*, or *CONT*  
**lb** [list, dict, `pandas.Series`, optional] Lower bounds of variables  
**ub** [list, dict, `pandas.Series`, optional] Upper bounds of variables  
**init** [float, optional] Initial values of variables

See also:

`sasoptpy.Model.add_variables()`  
`sasoptpy.Model.include()`

## Notes

- When working with a single model, use the `sasoptpy.Model.add_variables()` method.
- If a variable group object is created, it can be added to a model using the `sasoptpy.Model.include()` method.
- An individual variable inside the group can be accessed using indices.

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> print(repr(z[0, 'a']))
sasoptpy.Variable(name='z_0_a', lb=0, ub=10, vartype='CONT')
```

## Examples

```
>>> PERIODS = ['Period1', 'Period2', 'Period3']
>>> production = so.VariableGroup(PERIODS, vartype=so.INT,
                                name='production', lb=10)

>>> print(production)
Variable Group (production) [
  [Period1: production['Period1']]
  [Period2: production['Period2']]
  [Period3: production['Period3']]
]
```

```
>>> x = so.VariableGroup(4, vartype=so.BIN, name='x')
>>> print(x)
Variable Group (x) [
  [0: x[0]]
  [1: x[1]]
  [2: x[2]]
  [3: x[3]]
]
```

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z')
>>> print(z)
Variable Group (z) [
  [(0, 'a'): z[0, 'a']]
  [(0, 'b'): z[0, 'b']]
  [(0, 'c'): z[0, 'c']]
  [(1, 'a'): z[1, 'a']]
  [(1, 'b'): z[1, 'b']]
  [(1, 'c'): z[1, 'c']]
]
>>> print(repr(z))
sasoptpy.VariableGroup([0, 1], ['a', 'b', 'c'], name='z')
```

## Methods

<code>VariableGroup.get_name(self)</code>	Returns the name of the variable group
<code>VariableGroup.get_attributes(self)</code>	Returns an OrderedDict of main attributes
<code>VariableGroup.get_type(self)</code>	Returns the type of variable, valid values are:
<code>VariableGroup.get_members(self)</code>	Returns a dictionary of members
<code>VariableGroup.set_bounds(self[, lb, ub, members])</code>	Sets / updates bounds for the given variable
<code>VariableGroup.set_init(self, init)</code>	Sets / updates initial value for the given variable
<code>VariableGroup.mult(self, vector)</code>	Quick multiplication method for the variable groups
<code>VariableGroup.sum(self, \*argv)</code>	Quick sum method for the variable groups

### sasoptpy.VariableGroup.get\_name

`VariableGroup.get_name(self)`  
Returns the name of the variable group

#### Returns

**name** [string] Name of the variable group

#### Examples

```
>>> m = so.Model(name='m')
>>> var1 = m.add_variables(4, name='x')
>>> print(var1.get_name())
x
```

### sasoptpy.VariableGroup.get\_attributes

`VariableGroup.get_attributes(self)`  
Returns an OrderedDict of main attributes

#### Returns

**attributes** [dict] OrderedDict consists of *init*, *lb*, and *ub* attributes

### sasoptpy.VariableGroup.get\_type

`VariableGroup.get_type(self)`  
Returns the type of variable, valid values are:

- `sasoptpy.CONT`
- `sasoptpy.INT`
- `sasoptpy.BIN`

### `sasoptpy.VariableGroup.get_members`

`VariableGroup.get_members` (*self*)  
Returns a dictionary of members

### `sasoptpy.VariableGroup.set_bounds`

`VariableGroup.set_bounds` (*self*, *lb=None*, *ub=None*, *members=True*)  
Sets / updates bounds for the given variable

#### Parameters

**lb** [float, `pandas.Series`, optional] Lower bound

**ub** [float, `pandas.Series`, optional] Upper bound

#### Examples

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> print(repr(z[0, 'a']))
sasoptpy.Variable(name='z_0_a', lb=0, ub=10, vartype='CONT')
>>> z.set_bounds(lb=3, ub=5)
>>> print(repr(z[0, 'a']))
sasoptpy.Variable(name='z_0_a', lb=3, ub=5, vartype='CONT')
```

```
>>> u = so.VariableGroup(['a', 'b', 'c', 'd'], name='u')
>>> lb_vals = pd.Series([1, 4, 0, -1], index=['a', 'b', 'c', 'd'])
>>> u.set_bounds(lb=lb_vals)
>>> print(repr(u['b']))
sasoptpy.Variable(name='u_b', lb=4, ub=inf, vartype='CONT')
```

### `sasoptpy.VariableGroup.set_init`

`VariableGroup.set_init` (*self*, *init*)  
Sets / updates initial value for the given variable

#### Parameters

**init** [float, list, dict, `pandas.Series`] Initial value of the variables

#### Examples

```
>>> m = so.Model(name='m')
>>> y = m.add_variables(3, name='y')
>>> print(y._defn())
var y {{0,1,2}};
>>> y.set_init(5)
>>> print(y._defn())
var y {{0,1,2}} init 5;
```

**sasoptpy.VariableGroup.mult**VariableGroup.**mult** (*self*, *vector*)

Quick multiplication method for the variable groups

**Parameters****vector** [list, dictionary, pandas.Series, or pandas.DataFrame] Vector to be multiplied with the variable group**Returns****r** [Expression] An expression that is the product of the variable group with the given vector**Examples**

## Multiplying with a list

```
>>> x = so.VariableGroup(4, vartype=so.BIN, name='x')
>>> e1 = x.mult([1, 5, 6, 10])
>>> print(e1)
10.0 * x[3] + 6.0 * x[2] + x[0] + 5.0 * x[1]
```

## Multiplying with a dictionary

```
>>> y = so.VariableGroup([0, 1], ['a', 'b'], name='y', lb=0, ub=10)
>>> dvals = {(0, 'a'): 1, (0, 'b'): 2, (1, 'a'): -1, (1, 'b'): 5}
>>> e2 = y.mult(dvals)
>>> print(e2)
2.0 * y[0, 'b'] - y[1, 'a'] + y[0, 'a'] + 5.0 * y[1, 'b']
```

## Multiplying with a pandas.Series object

```
>>> u = so.VariableGroup(['a', 'b', 'c', 'd'], name='u')
>>> ps = pd.Series([0.1, 1.5, -0.2, 0.3], index=['a', 'b', 'c', 'd'])
>>> e3 = u.mult(ps)
>>> print(e3)
1.5 * u['b'] + 0.1 * u['a'] - 0.2 * u['c'] + 0.3 * u['d']
```

## Multiplying with a pandas.DataFrame object

```
>>> data = np.random.rand(3, 3)
>>> df = pd.DataFrame(data, columns=['a', 'b', 'c'])
>>> print(df)
NOTE: Initialized model model1
      a      b      c
0  0.966524  0.237081  0.944630
1  0.821356  0.074753  0.345596
2  0.065229  0.037212  0.136644
>>> y = m.add_variables(3, ['a', 'b', 'c'], name='y')
>>> e = y.mult(df)
>>> print(e)
0.9665237354418064 * y[0, 'a'] + 0.23708064143289442 * y[0, 'b'] +
0.944629500537536 * y[0, 'c'] + 0.8213562592159828 * y[1, 'a'] +
0.07475256894157478 * y[1, 'b'] + 0.3455957019116668 * y[1, 'c'] +
0.06522945752546017 * y[2, 'a'] + 0.03721153533250843 * y[2, 'b'] +
0.13664422498043194 * y[2, 'c']
```

### sasoptpy.VariableGroup.sum

`VariableGroup.sum(self, *argv)`

Quick sum method for the variable groups

#### Parameters

**argv** [Arguments] List of indices for the sum

#### Returns

**r** [Expression] Expression that represents the sum of all variables in the group

### Examples

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> e1 = z.sum('*', '*')
>>> print(e1)
z[1, 'c'] + z[1, 'a'] + z[1, 'b'] + z[0, 'a'] + z[0, 'b'] +
z[0, 'c']
>>> e2 = z.sum('*', 'a')
>>> print(e2)
z[1, 'a'] + z[0, 'a']
>>> e3 = z.sum('*', ['a', 'b'])
>>> print(e3)
z[1, 'a'] + z[0, 'b'] + z[1, 'b'] + z[0, 'a']
```

## 5.1.6 Constraint

### Constructor

---

<code>Constraint(**kwargs)</code>	Creates a linear or quadratic constraint for optimization models
-----------------------------------	------------------------------------------------------------------

---

### sasoptpy.Constraint

**class Constraint** (*\*\*kwargs*)

Bases: `sasoptpy.core.expression.Expression`

Creates a linear or quadratic constraint for optimization models

Constraints should be created by adding logical relations to *Expression* objects.

#### Parameters

**exp** [Expression] A logical expression that forms the constraint

**direction** [string] Direction of the logical expression, 'E' (=), 'L' (<=) or 'G' (>=)

**name** [string, optional] Name of the constraint object

**crange** [float, optional] Range for ranged constraints

See also:

*`sasoptpy.Model.add_constraint()`*

## Notes

- A constraint can be generated in multiple ways:
  1. Using the `sasoptpy.Model.add_constraint()` method

```
>>> m = so.Model(name='m')
>>> c1 = m.add_constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
```

2. Using the constructor

```
>>> c1 = sasoptpy.Constraint(3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
```

- The same constraint can be included into other models using the `Model.include()` method.

## Examples

```
>>> x = so.Variable(name='x')
>>> y = so.Variable(name='y')
>>> c1 = so.Constraint( 3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( - 5.0 * y + 3.0 * x <= 10, name='c1')
```

```
>>> c2 = so.Constraint( - x + 2 * y - 5, direction='L', name='c2')
sasoptpy.Constraint( - x + 2.0 * y <= 5, name='c2')
```

## Methods

<code>Constraint.get_value(self[, rhs])</code>	Returns the current value of the constraint
<code>Constraint.set_block(self, block_number)</code>	Sets the decomposition block number for a constraint
<code>Constraint.set_direction(self, direction)</code>	Changes the direction of a constraint
<code>Constraint.set_rhs(self, value)</code>	Changes the RHS of a constraint
<code>Constraint.update_var_coef(self, var, value)</code>	Updates the coefficient of a variable inside the constraint

### sasoptpy.Constraint.get\_value

`Constraint.get_value(self, rhs=False)`

Returns the current value of the constraint

#### Parameters

- rhs** [boolean, optional] Whether constant values (RHS) will be included in the value or not. Default is false

## Examples

```
>>> x = so.Variable(name='x', init=2)
>>> c = so.Constraint(x ** 2 + 2 * x <= 15, name='c')
>>> print(c.get_value())
8
>>> print(c.get_value(rhs=True))
-7
```

## `sasoptpy.Constraint.set_block`

`Constraint.set_block(self, block_number)`  
Sets the decomposition block number for a constraint

### Parameters

**block\_number** [int] Block number of the constraint

## Examples

```
>>> c1 = m.add_constraints((x + 2 * y[i] <= 5 for i in NODES),
                           name='c1')
>>> for i in NODES:
    c1[i].set_block(i)
```

## `sasoptpy.Constraint.set_direction`

`Constraint.set_direction(self, direction)`  
Changes the direction of a constraint

### Parameters

**direction** [string] Direction of the constraint, 'E', 'L', or 'G' for equal to, less than or equal to, and greater than or equal to, respectively

## Examples

```
>>> c1 = so.Constraint(exp=3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint( 3.0 * x - 5.0 * y <= 10, name='c1')
>>> c1.set_direction('G')
>>> print(repr(c1))
sasoptpy.Constraint( 3.0 * x - 5.0 * y >= 10, name='c1')
```

**sasoptpy.Constraint.set\_rhs**`Constraint.set_rhs(self, value)`

Changes the RHS of a constraint

**Parameters****value** [float] New RHS value for the constraint**Examples**

```

>>> x = m.add_variable(name='x')
>>> y = m.add_variable(name='y')
>>> c = m.add_constraint(x + 3*y <= 10, name='con_1')
>>> print(c)
x + 3.0 * y <= 10
>>> c.set_rhs(5)
>>> print(c)
x + 3.0 * y <= 5

```

**sasoptpy.Constraint.update\_var\_coef**`Constraint.update_var_coef(self, var, value)`

Updates the coefficient of a variable inside the constraint

**Parameters****var** [Variable] Variable to be updated**value** [float] Coefficient of the variable in the constraint

See also:

**sasoptpy.Model.set\_coef()****Examples**

```

>>> c1 = so.Constraint(exp=3 * x - 5 * y <= 10, name='c1')
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y + 3.0 * x <= 10, name='c1')
>>> c1.update_var_coef(x, -1)
>>> print(repr(c1))
sasoptpy.Constraint(- 5.0 * y - x <= 10, name='c1')

```

## 5.1.7 Constraint Group

### Constructor

---

<code>ConstraintGroup(**kwargs)</code>	Creates a group of <i>Constraint</i> objects
----------------------------------------	----------------------------------------------

---

### `sasoptpy.ConstraintGroup`

**class** `ConstraintGroup` (*\*\*kwargs*)

Bases: `sasoptpy.core.group.Group`

Creates a group of *Constraint* objects

#### Parameters

**argv** [Generator-type object] A Python generator that includes *Expression* objects

**name** [string, optional] Name (prefix) of the constraints

See also:

`sasoptpy.Model.add_constraints()`

`sasoptpy.Model.include()`

### Notes

Use `sasoptpy.Model.add_constraints()` when working with a single model.

### Examples

```
>>> var_ind = ['a', 'b', 'c', 'd']
>>> u = so.VariableGroup(var_ind, name='u')
>>> t = so.Variable(name='t')
>>> cg = so.ConstraintGroup((u[i] + 2 * t <= 5 for i in var_ind), name='cg')
>>> print(cg)
Constraint Group (cg) [
  [a: 2.0 * t + u['a'] <= 5]
  [b: u['b'] + 2.0 * t <= 5]
  [c: 2.0 * t + u['c'] <= 5]
  [d: 2.0 * t + u['d'] <= 5]
]
```

```
>>> z = so.VariableGroup(2, ['a', 'b', 'c'], name='z', lb=0, ub=10)
>>> cg2 = so.ConstraintGroup((2 * z[i, j] + 3 * z[i-1, j] >= 2 for i in
                             [1] for j in ['a', 'b', 'c']), name='cg2')
>>> print(cg2)
Constraint Group (cg2) [
  [(1, 'a'): 3.0 * z[0, 'a'] + 2.0 * z[1, 'a'] >= 2]
  [(1, 'b'): 2.0 * z[1, 'b'] + 3.0 * z[0, 'b'] >= 2]
  [(1, 'c'): 2.0 * z[1, 'c'] + 3.0 * z[0, 'c'] >= 2]
]
```

## Methods

<code>ConstraintGroup.get_name(self)</code>	Returns the name of the constraint group
<code>ConstraintGroup.get_all_keys(self)</code>	Returns a list of all keys (indices) in the group
<code>ConstraintGroup.get_expressions(self[, rhs])</code>	Returns constraints as a list of expressions
<code>ConstraintGroup.get_members(self)</code>	Returns a dictionary of members

### sasoptpy.ConstraintGroup.get\_name

`ConstraintGroup.get_name(self)`  
Returns the name of the constraint group

#### Returns

**name** [string] Name of the constraint group

### Examples

```
>>> m = so.Model(name='m')
>>> x = m.add_variable(name='x')
>>> indices = ['a', 'b', 'c']
>>> y = m.add_variables(indices, name='y')
>>> c1 = m.add_constraints((x + y[i] <= 4 for i in indices),
                           name='con1')
>>> print(c1.get_name())
con1
```

### sasoptpy.ConstraintGroup.get\_all\_keys

`ConstraintGroup.get_all_keys(self)`  
Returns a list of all keys (indices) in the group

### sasoptpy.ConstraintGroup.get\_expressions

`ConstraintGroup.get_expressions(self, rhs=False)`  
Returns constraints as a list of expressions

#### Parameters

**rhs** [boolean, optional] Whether to pass the constant part (rhs) of the constraint or not

#### Returns

**df** [pandas.DataFrame] Returns a DataFrame consisting of constraints as expressions

## Examples

```
>>> m = so.Model(name='m')
>>> var_ind = ['a', 'b', 'c', 'd']
>>> u = m.add_variables(var_ind, name='u')
>>> t = m.add_variable(name='t')
>>> cg = so.ConstraintGroup((u[i] + 2 * t <= 5 for i in var_ind),
                             name='cg')
>>> ce = cg.get_expressions()
>>> print(ce)
              cg
a  u[a] + 2 * t
b  u[b] + 2 * t
c  u[c] + 2 * t
d  u[d] + 2 * t
>>> ce_rhs = cg.get_expressions(rhs=True)
>>> print(ce_rhs)
              cg
a  u[a] + 2 * t - 5
b  u[b] + 2 * t - 5
c  u[c] + 2 * t - 5
d  u[d] + 2 * t - 5
```

## sasoptpy.ConstraintGroup.get\_members

`ConstraintGroup.get_members(self)`  
Returns a dictionary of members

## 5.1.8 Workspace

### Constructor

---

<code>Workspace(name[, session])</code>	Workspace represents an OPTMODEL block that allows multiple solves
-----------------------------------------	--------------------------------------------------------------------

---

## sasoptpy.Workspace

**class** `Workspace(name, session=None)`

Bases: `object`

Workspace represents an OPTMODEL block that allows multiple solves

### Parameters

**name** [string] Name of the workspace

**session** [`saspy.SASsession` or `swat.cas.connection.CAS`, optional] Session to be submitted

## Methods

<code>Workspace.get_elements(self)</code>	Returns a list of elements in the Workspace
<code>Workspace.set_active_model(self, model)</code>	Marks given model as active, to be used in solve statements
<code>Workspace.append(self, element)</code>	Appends a new element (operation or statement) to the Workspace
<code>Workspace.submit(self, <i>\\</i>*kwargs)</code>	Submits the Workspace as an OPTMODEL block and returns solutions
<code>Workspace.parse_solve_responses(self)</code>	Grabs the solutions to all solve statements
<code>Workspace.parse_print_responses(self)</code>	Grabs responses to all print statements
<code>Workspace.get_variable(self, name)</code>	Obtains the value of a given variable name
<code>Workspace.set_variable_value(self, name, value)</code>	Sets variable value
<code>Workspace.to_optmodel(self)</code>	Returns equivalent OPTMODEL code of given workspace

### `sasoptpy.Workspace.get_elements`

`Workspace.get_elements(self)`  
Returns a list of elements in the Workspace

### `sasoptpy.Workspace.set_active_model`

`Workspace.set_active_model(self, model)`  
Marks given model as active, to be used in solve statements

#### Parameters

**model** [*Model*] Model to be activated

### `sasoptpy.Workspace.append`

`Workspace.append(self, element)`  
Appends a new element (operation or statement) to the Workspace

#### Parameters

**element** [*sasoptpy.abstract.Statement*] Any statement that can be appended

### `sasoptpy.Workspace.submit`

`Workspace.submit(self, **kwargs)`  
Submits the Workspace as an OPTMODEL block and returns solutions

**sasoptpy.Workspace.parse\_solve\_responses**

`Workspace.parse_solve_responses (self)`  
Grabs the solutions to all solve statements

**sasoptpy.Workspace.parse\_print\_responses**

`Workspace.parse_print_responses (self)`  
Grabs responses to all print statements

**sasoptpy.Workspace.get\_variable**

`Workspace.get_variable (self, name)`  
Obtains the value of a given variable name

**Parameters**

**name** [string] Name of the variable

**sasoptpy.Workspace.set\_variable\_value**

`Workspace.set_variable_value (self, name, value)`  
Sets variable value

**Parameters**

**name** [string] Name of the variable

**value** [float] New value of the variable

**sasoptpy.Workspace.to\_optmodel**

`Workspace.to_optmodel (self)`  
Returns equivalent OPTMODEL code of given workspace

**Returns**

**optmodel** [string] Generated OPTMODEL code of the workspace object

**5.2 Abstract**

**5.2.1 Abstract**

**Main classes**

---

<code>Parameter(**kwargs)</code>	
<code>ParameterGroup(**kwargs)</code>	
<code>Set(**kwargs)</code>	Creates an index set to be represented inside PROC OPTMODEL

---

Continued on next page

Table 26 – continued from previous page

<i>SetIterator</i> (initset[, name, datatype])	Creates an iterator object for a given Set
<i>SetIteratorGroup</i> (initset[, datatype, names])	
<i>Statement</i> ()	

**sasoptpy.abstract.Parameter****class** **Parameter** (\*\*kwargs)Bases: `sasoptpy.core.expression.Expression`**sasoptpy.abstract.ParameterGroup****class** **ParameterGroup** (\*\*kwargs)Bases: `object`**sasoptpy.abstract.Set****class** **Set** (\*\*kwargs)Bases: `object`

Creates an index set to be represented inside PROC OPTMODEL

**Parameters****name** [string] Name of the parameter**init** [Expression, optional] Initial value expression of the parameter**settype** [list, optional] List of types for the set, consisting of ‘num’ and ‘str’ values**Examples**

```
>>> I = so.Set('I')
>>> print(I._defn())
set I;
```

```
>>> J = so.Set('J', settype=['num', 'str'])
>>> print(J._defn())
set <num, str> J;
```

```
>>> N = so.Parameter(name='N', init=5)
>>> K = so.Set('K', init=so.exp_range(1,N))
>>> print(K._defn())
set K = 1..N;
```

### sasoptpy.abstract.SetIterator

**class SetIterator** (*initset, name=None, datatype=None*)  
Bases: `sasoptpy.core.expression.Expression`

Creates an iterator object for a given Set

#### Parameters

- initset** [Set] Set to be iterated on
- name** [string, optional] Name of the iterator
- datatype** [string, optional] Type of the iterator

#### Notes

- SetIterator objects are automatically created when looping over a *Set*.
- This class is mainly intended for internal use.
- The `group` parameter consists of following keys
  - **order** : int Order of the parameter inside the group
  - **outof** : int Total number of indices inside the group
  - **id** : int ID number assigned to group by Python

### sasoptpy.abstract.SetIteratorGroup

**class SetIteratorGroup** (*initset, datatype=None, names=None*)  
Bases: `collections.OrderedDict`, `sasoptpy.core.expression.Expression`

### sasoptpy.abstract.Statement

**class Statement**  
Bases: `abc.ABC`

#### Statements

---

*Assignment*(identifier, expression[, keyword])

---

*CoForLoopStatement*(\*args)

---

*CreateDataStatement*(table, index[, columns])

---

*DropStatement*(\*kwargs)

---

*ForLoopStatement*(\*args)

---

*IfElseStatement*(logic\_expression, if\_statement)

---

*LiteralStatement*(\*kwargs)

---

*ObjectiveStatement*(expression, \*\*kwargs)

---

*ReadDataStatement*(table, index[, columns])

---

*SolveStatement*(\*args, \*\*kwargs)

---

*FixStatement*(\*elements)

---

*UnfixStatement*(\*elements)

---

Continued on next page

Table 27 – continued from previous page

---

`PrintStatement(*args)`

---

### **sasoptpy.abstract.statement.Assignment**

**class Assignment** (*identifier, expression, keyword=None*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

**\_\_init\_\_** (*self, identifier, expression, keyword=None*)

Initialize self. See `help(type(self))` for accurate signature.

#### **Methods**

<code>__init__(self, identifier, expression[, keyword])</code>	Initialize self.
<code>append(self, *args, **kwargs)</code>	
<code>fix_value(obj, value)</code>	
<code>get_response(self)</code>	
<code>is_internal(self)</code>	
<code>set_bounds(var, **kwargs)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	
<code>set_value(obj, value)</code>	

### **sasoptpy.abstract.statement.CoForLoopStatement**

**class CoForLoopStatement** (*\*args*)

Bases: `sasoptpy.abstract.statement.for_loop.ForLoopStatement`

**\_\_init\_\_** (*self, \*args*)

Initialize self. See `help(type(self))` for accurate signature.

#### **Methods**

<code>__init__(self, *args)</code>	Initialize self.
<code>append(self, element)</code>	
<code>cofor_loop(*args)</code>	
<code>for_loop(*args)</code>	
<code>get_response(self)</code>	
<code>is_internal(self)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	

**sasoptpy.abstract.statement.CreateDataStatement**

```
class CreateDataStatement (table, index, columns=None)
    Bases: sasoptpy.abstract.statement.statement_base.Statement
    __init__ (self, table, index, columns=None)
        Initialize self. See help(type(self)) for accurate signature.
```

**Methods**

<code>__init__(self, table, index[, columns])</code>	Initialize self.
<code>append(self, element, <i>\**kwargs</i>)</code>	
<code>create_data(*args, <i>\**kwargs</i>)</code>	
<code>get_column_str(c)</code>	
<code>get_columns_expr(self)</code>	
<code>get_index_expr(self)</code>	
<code>get_response(self)</code>	
<code>get_table_expr(self)</code>	
<code>get_table_name(self)</code>	
<code>is_internal(self)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	

**sasoptpy.abstract.statement.DropStatement**

```
class DropStatement (**kwargs)
    Bases: sasoptpy.abstract.statement.statement_base.Statement
    __init__ (*args, **kwargs)
```

**Methods**

<code>__init__(*args, <i>\**kwargs</i>)</code>	
<code>append(self, element)</code>	
<code>drop_constraint(*constraints)</code>	
<code>get_response(self)</code>	
<code>is_internal(self)</code>	
<code>model_drop_constraint(_, c)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	

**sasoptpy.abstract.statement.ForLoopStatement****class ForLoopStatement** (\*args)

Bases: sasoptpy.abstract.statement.statement\_base.Statement

**\_\_init\_\_** (self, \*args)

Initialize self. See help(type(self)) for accurate signature.

**Methods**

<b>__init__</b> (self, \*args)	Initialize self.
append(self, element)	
for_loop(\*args)	
get_response(self)	
is_internal(self)	
set_internal(self, value)	
set_response(self, response)	

**sasoptpy.abstract.statement.IfElseStatement****class IfElseStatement** (logic\_expression, if\_statement, else\_statement=None)

Bases: sasoptpy.abstract.statement.if\_else.NestedConditions

**\_\_init\_\_** (self, logic\_expression, if\_statement, else\_statement=None)

Initialize self. See help(type(self)) for accurate signature.

**Methods**

<b>__init__</b> (self, logic_expression, if_statement)	Initialize self.
append(self, element)	
get_response(self)	
if_condition(logic_expression, if_statement)	
is_internal(self)	
set_internal(self, value)	
set_response(self, response)	

**sasoptpy.abstract.statement.LiteralStatement****class LiteralStatement** (\*\*kwargs)

Bases: sasoptpy.abstract.statement.statement\_base.Statement

**\_\_init\_\_** (\*args, \*\*kwargs)

## Methods

<code>__init__</code>	<code>(*args, **kwargs)</code>
<code>append</code>	<code>(self, literal)</code>
<code>diff</code>	<code>(*args)</code>
<code>expand</code>	<code>()</code>
<code>get_response</code>	<code>(self)</code>
<code>is_internal</code>	<code>(self)</code>
<code>set_internal</code>	<code>(self, value)</code>
<code>set_response</code>	<code>(self, response)</code>
<code>substring</code>	<code>(main_string, first_pos, last_pos)</code>
<code>union</code>	<code>(*args)</code>
<code>use_problem</code>	<code>(problem)</code>

## `sasoptpy.abstract.statement.ObjectiveStatement`

**class** `ObjectiveStatement` (*expression*, *\*\*kwargs*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

`__init__` (*self*, *expression*, *\*\*kwargs*)

Initialize self. See `help(type(self))` for accurate signature.

## Methods

<code>__init__</code>	<code>(self, expression, **kwargs)</code>	Initialize self.
<code>append</code>	<code>(self)</code>	
<code>get_response</code>	<code>(self)</code>	
<code>is_internal</code>	<code>(self)</code>	
<code>set_internal</code>	<code>(self, value)</code>	
<code>set_objective</code>	<code>(expression, name, sense)</code>	
<code>set_response</code>	<code>(self, response)</code>	

## `sasoptpy.abstract.statement.ReadDataStatement`

**class** `ReadDataStatement` (*table*, *index*, *columns=None*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

`__init__` (*self*, *table*, *index*, *columns=None*)

Initialize self. See `help(type(self))` for accurate signature.

## Methods

<code>__init__(self, table, index[, columns])</code>	Initialize self.
<code>append(self, element, <i>\**kwargs</i>)</code>	
<code>flatten_column(col)</code>	
<code>get_column_str(c)</code>	
<code>get_columns_expr(self)</code>	
<code>get_index_expr(self)</code>	
<code>get_response(self)</code>	
<code>get_table_expr(self)</code>	
<code>get_target_expr(target)</code>	
<code>is_internal(self)</code>	
<code>read_data(<i>\*args</i>, <i>\**kwargs</i>)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	

## sasoptpy.abstract.statement.SolveStatement

**class SolveStatement** (*\*args*, *\*\*kwargs*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

**\_\_init\_\_** (*self*, *\*args*, *\*\*kwargs*)

Initialize self. See `help(type(self))` for accurate signature.

## Methods

<code>__init__(self, <i>\*args</i>, <i>\**kwargs</i>)</code>	Initialize self.
<code>append(self, element)</code>	
<code>get_problem_summary(self)</code>	
<code>get_response(self)</code>	
<code>get_solution_summary(self)</code>	
<code>is_internal(self)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, problem_summary, ...)</code>	
<code>solve(<i>\*args</i>, <i>\**kwargs</i>)</code>	
<code>solve_model(model, <i>\**kwargs</i>)</code>	

## sasoptpy.abstract.statement.FixStatement

**class FixStatement** (*\*elements*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

**\_\_init\_\_** (*self*, *\*elements*)

Initialize self. See `help(type(self))` for accurate signature.

## Methods

<code>__init__(self, \*elements)</code>	Initialize self.
<code>append(self, element)</code>	
<code>fix(\*items)</code>	
<code>get_response(self)</code>	
<code>is_internal(self)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	

## sasoptpy.abstract.statement.UnfixStatement

**class UnfixStatement** (*\\*elements*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

`__init__(self, \*elements)`

Initialize self. See `help(type(self))` for accurate signature.

## Methods

<code>__init__(self, \*elements)</code>	Initialize self.
<code>append(self, element)</code>	
<code>get_response(self)</code>	
<code>is_internal(self)</code>	
<code>set_internal(self, value)</code>	
<code>set_response(self, response)</code>	
<code>unfix(\*items)</code>	

## sasoptpy.abstract.statement.PrintStatement

**class PrintStatement** (*\\*args*)

Bases: `sasoptpy.abstract.statement.statement_base.Statement`

`__init__(self, \*args)`

Initialize self. See `help(type(self))` for accurate signature.

## Methods

<code>__init__(self, \*args)</code>	Initialize self.
<code>allow_print_names(self)</code>	
<code>append(self, arg)</code>	
<code>get_response(self)</code>	
<code>is_internal(self)</code>	
<code>print_item(\*args)</code>	
<code>put_item(\*args[, names])</code>	
<code>set_internal(self, value)</code>	
<code>set_print_type(self, print_type)</code>

-------------------------------------------

---

## 5.3 Interface

### 5.3.1 Interface

#### CAS (Viya)

---

<code>CASMediator</code> ( <i>caller</i> , <i>cas_session</i> )	Handles the connection between sasoptpy and SAS Viya (CAS) server
-----------------------------------------------------------------	-------------------------------------------------------------------

---

#### sasoptpy.interface.CASMediator

**class** `CASMediator` (*caller*, *cas\_session*)

Bases: `sasoptpy.interface.solver.mediator.Mediator`

Handles the connection between sasoptpy and SAS Viya (CAS) server

##### Parameters

**caller** [`Model` or `Workspace`] Model or workspace that mediator belongs to

**cas\_session** [`swat.cas.connection.CAS`] CAS connection

##### Notes

- CAS Mediator is used by `Model` and `Workspace` objects internally.

#### Model

---

<code>CASMediator.solve</code> ( <i>self</i> , <i>**kwargs</i> )	Solve action for <code>Model</code> objects
<code>CASMediator.tune</code> ( <i>self</i> , <i>**kwargs</i> )	Checks if CAS session has <code>optimizaiton.tuner</code> capability and calls <code>tune_problem()</code>
<code>CASMediator.tune_problem</code> ( <i>self</i> , <i>**kwargs</i> )	Calls <code>optimization.tuner</code> CAS action to find out ideal configuration
<code>CASMediator.solve_with_mps</code> ( <i>self</i> , <i>**kwargs</i> )	Submits the problem in MPS ( <code>DataFrame</code> ) format, supported by old versions
<code>CASMediator.solve_with_optmodel</code> ( <i>self</i> , <i>**kwargs</i> )	Submits the problem in OPTMODEL format
<code>CASMediator.parse_cas_solution</code> ( <i>self</i> )	Performs post-solve operations
<code>CASMediator.parse_cas_table</code> ( <i>self</i> , <i>table</i> )	Converts requested <code>swat.cas.table.CASTable</code> objects to <code>swat.dataframe.SASDataFrame</code>
<code>CASMediator.set_variable_values</code> ( <i>self</i> , <i>solution</i> )	Performs post-solve assignment of variable values
<code>CASMediator.set_constraint_values</code> ( <i>self</i> , <i>solution</i> )	Performs post-solve assignment of constraint values
<code>CASMediator.set_model_objective_value</code> ( <i>self</i> , <i>value</i> )	Performs post-solve assignment of objective values

---

Continued on next page

Table 42 – continued from previous page

<code>CASMediator.set_variable_init_values(self)</code>	Performs post-solve assignment of variable initial values
<code>CASMediator.upload_user_blocks(self)</code>	Uploads user-defined decomposition blocks to the CAS server
<code>CASMediator.upload_model(self[, name, ...])</code>	Converts internal model to MPS table and upload to CAS session

### **sasoptpy.interface.CASMediator.solve**

`CASMediator.solve(self, **kwargs)`  
Solve action for `Model` objects

### **sasoptpy.interface.CASMediator.tune**

`CASMediator.tune(self, **kwargs)`  
Checks if CAS session has optimization.tuner capability and calls `tune_problem()`

### **sasoptpy.interface.CASMediator.tune\_problem**

`CASMediator.tune_problem(self, **kwargs)`  
Calls optimization.tuner CAS action to find out ideal configuration

### **sasoptpy.interface.CASMediator.solve\_with\_mps**

`CASMediator.solve_with_mps(self, **kwargs)`  
Submits the problem in MPS (`DataFrame`) format, supported by old versions

#### **Parameters**

**kwargs** [dict] Keyword arguments for solver settings and options

#### **Returns**

**primal\_solution** [`swat.dataframe.SASDataFrame`] Solution of the model or `None`

### **sasoptpy.interface.CASMediator.solve\_with\_optmodel**

`CASMediator.solve_with_optmodel(self, **kwargs)`  
Submits the problem in OPTMODEL format

#### **Parameters**

**kwargs** [dict] Keyword arguments for solver settings and options

#### **Returns**

**primal\_solution** [`swat.dataframe.SASDataFrame`] Solution of the model or `None`

**sasoptpy.interface.CASMediator.parse\_cas\_solution**

`CASMediator.parse_cas_solution(self)`

Performs post-solve operations

**Returns**

**solution** [`swat.dataframe.SASDataFrame`] Solution of the problem

**sasoptpy.interface.CASMediator.parse\_cas\_table**

`CASMediator.parse_cas_table(self, table)`

Converts requested `swat.cas.table.CASTable` objects to `swat.dataframe.SASDataFrame`

**sasoptpy.interface.CASMediator.set\_variable\_values**

`CASMediator.set_variable_values(self, solution)`

Performs post-solve assignment of variable values

**Parameters**

**solution** [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

**sasoptpy.interface.CASMediator.set\_constraint\_values**

`CASMediator.set_constraint_values(self, solution)`

Performs post-solve assignment of constraint values

**Parameters**

**solution** [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

**sasoptpy.interface.CASMediator.set\_model\_objective\_value**

`CASMediator.set_model_objective_value(self)`

Performs post-solve assignment of objective values

**Parameters**

**solution** [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

**sasoptpy.interface.CASMediator.set\_variable\_init\_values**

`CASMediator.set_variable_init_values(self)`

Performs post-solve assignment of variable initial values

**Parameters**

**solution** [`class:swat.dataframe.SASDataFrame`] Primal solution of the problem

sasoptpy.interface.CASMediator.upload\_user\_blocks

CASMediator.upload\_user\_blocks (self)  
Uploads user-defined decomposition blocks to the CAS server

Returns  
name [string] CAS table name of the user-defined decomposition blocks

Examples

```
>>> userblocks = m.upload_user_blocks()
>>> m.solve(milp={'decomp': {'blocks': userblocks}})
```

sasoptpy.interface.CASMediator.upload\_model

CASMediator.upload\_model (self, name=None, replace=True, constant=False, verbose=False)  
Converts internal model to MPS table and upload to CAS session

Parameters  
name [string, optional] Desired name of the MPS table on the server  
replace [boolean, optional] Option to replace the existing MPS table

Returns  
frame [swat.cas.table.CASTable] Reference to the uploaded CAS Table

Notes

- This method returns None if the model session is not valid.
- Name of the table is randomly assigned if name argument is None or not given.
- This method should not be used if Model.solve() is going to be used. Model.solve() calls this method internally.

Workspace

CASMediator.submit(self, \**kwargs)	Submit action for custom input and Workspace objects
CASMediator.submit_optmodel_code(self, ...)	Converts caller into OPTMODEL code and submits using optimization.runOptmodel action
CASMediator.parse_cas_workspace_response(self)	Parses results of workspace submission
CASMediator.set_workspace_variable_value(self, ...)	Performs post-solve assignment of Workspace variable values

**sasoptpy.interface.CASMediator.submit**

`CASMediator.submit(self, **kwargs)`  
 Submit action for custom input and `Workspace` objects

**sasoptpy.interface.CASMediator.submit\_optmodel\_code**

`CASMediator.submit_optmodel_code(self, **kwargs)`  
 Converts caller into `OPTMODEL` code and submits using `optimization.runOptmodel` action

**Parameters**

**kwargs** : Solver settings and options

**sasoptpy.interface.CASMediator.parse\_cas\_workspace\_response**

`CASMediator.parse_cas_workspace_response(self)`  
 Parses results of workspace submission

**sasoptpy.interface.CASMediator.set\_workspace\_variable\_values**

`CASMediator.set_workspace_variable_values(self, solution)`  
 Performs post-solve assignment of `Workspace` variable values

**SAS**

---

<code>SASMediator</code> (caller, sas_session)	Handles the connection between sasoptpy and SAS instance
------------------------------------------------	----------------------------------------------------------

---

**sasoptpy.interface.SASMediator**

**class SASMediator**(caller, sas\_session)  
 Bases: `sasoptpy.interface.solver.mediator.Mediator`

Handles the connection between sasoptpy and SAS instance

**Parameters**

**caller** [`Model` or `Workspace`] Model or workspace that mediator belongs to

**sas\_session** [`saspy.SASsession`] SAS session object

## Notes

- SAS Mediator is used by `Model` and `Workspace` objects internally.

## Model

<code>SASMediator.solve(self, **kwargs)</code>	Solve action for <code>Model</code> objects
<code>SASMediator.solve_with_mps(self, **kwargs)</code>	Submits the problem in MPS ( <code>DataFrame</code> ) format, supported by old versions
<code>SASMediator.solve_with_optmodel(self, **kwargs)</code>	Submits the problem in OPTMODEL format
<code>SASMediator.parse_sas_mps_solution(self)</code>	Parses MPS solution after <i>solve</i> and returns solution
<code>SASMediator.parse_sas_solution(self)</code>	Performs post-solve operations
<code>SASMediator.parse_sas_table(self, table_name)</code>	Converts requested table name into <code>pandas.DataFrame</code>
<code>SASMediator.convert_to_original(self, table)</code>	Converts variable names to their original format if a placeholder gets used
<code>SASMediator.perform_postsolve_operations(self)</code>	Performs post-solve operations for proper output display

### `sasoptpy.interface.SASMediator.solve`

`SASMediator.solve(self, **kwargs)`  
Solve action for `Model` objects

### `sasoptpy.interface.SASMediator.solve_with_mps`

`SASMediator.solve_with_mps(self, **kwargs)`  
Submits the problem in MPS (`DataFrame`) format, supported by old versions

#### Parameters

**kwargs** [dict] Keyword arguments for solver settings and options

#### Returns

**primal\_solution** [`pandas.DataFrame`] Solution of the model or `None`

### `sasoptpy.interface.SASMediator.solve_with_optmodel`

`SASMediator.solve_with_optmodel(self, **kwargs)`  
Submits the problem in OPTMODEL format

#### Parameters

**kwargs** [dict] Keyword arguments for solver settings and options

#### Returns

**primal\_solution** [`pandas.DataFrame`] Solution of the model or `None`

**sasoptpy.interface.SASMediator.parse\_sas\_mps\_solution**

`SASMediator.parse_sas_mps_solution(self)`  
 Parses MPS solution after *solve* and returns solution

**sasoptpy.interface.SASMediator.parse\_sas\_solution**

`SASMediator.parse_sas_solution(self)`  
 Performs post-solve operations

**Returns**

**solution** [`pandas.DataFrame`] Solution of the problem

**sasoptpy.interface.SASMediator.parse\_sas\_table**

`SASMediator.parse_sas_table(self, table_name)`  
 Converts requested table name into `pandas.DataFrame`

**sasoptpy.interface.SASMediator.convert\_to\_original**

`SASMediator.convert_to_original(self, table)`  
 Converts variable names to their original format if a placeholder gets used

**sasoptpy.interface.SASMediator.perform\_postsolve\_operations**

`SASMediator.perform_postsolve_operations(self)`  
 Performs post-solve operations for proper output display

**Workspace**

<code>SASMediator.submit(self, \*\*kwargs)</code>	Submit action for custom input and Workspace objects
<code>SASMediator.submit_optmodel_code(self, ...)</code>	Submits given Workspace object in OPTMODEL format
<code>SASMediator.parse_sas_workspace_response(self)</code>	Parses results of workspace submission
<code>SASMediator.set_workspace_variable_value(self, ...)</code>	Performs post-solve assignment of Workspace variable values

**sasoptpy.interface.SASMediator.submit**

`SASMediator.submit(self, **kwargs)`  
Submit action for custom input and `Workspace` objects

**sasoptpy.interface.SASMediator.submit\_optmodel\_code**

`SASMediator.submit_optmodel_code(self, **kwargs)`  
Submits given `Workspace` object in `OPTMODEL` format

**Parameters**

**kwargs** : Solver settings and options

**sasoptpy.interface.SASMediator.parse\_sas\_workspace\_response**

`SASMediator.parse_sas_workspace_response(self)`  
Parses results of workspace submission

**sasoptpy.interface.SASMediator.set\_workspace\_variable\_values**

`SASMediator.set_workspace_variable_values(self, solution)`  
Performs post-solve assignment of `Workspace` variable values

## 5.4 Functions

### 5.4.1 Functions

#### Utility Functions

<code>dict_to_frame(dictobj[, cols])</code>	Converts dictionaries to <code>DataFrame</code> objects for pretty printing
<code>exp_range(start, stop[, step])</code>	Creates a set within given range
<code>flatten_frame(df[, swap])</code>	Converts a <code>pandas.DataFrame</code> object into <code>pandas.Series</code>
<code>get_solution_table(*argv[, key, rhs])</code>	
<code>quick_sum(argv)</code>	
<code>reset()</code>	Resets package configs and internal counters

**sasoptpy.dict\_to\_frame****dict\_to\_frame** (*dictobj*, *cols=None*)

Converts dictionaries to DataFrame objects for pretty printing

**Parameters****dictobj** [dict] Dictionary to be converted**cols** [list, optional] Column names**Returns****frobj** [DataFrame] DataFrame representation of the dictionary**Examples**

```
>>> d = {'coal': {'period1': 1, 'period2': 5, 'period3': 7},
>>>       'steel': {'period1': 8, 'period2': 4, 'period3': 3},
>>>       'copper': {'period1': 5, 'period2': 7, 'period3': 9}}
>>> df = so.dict_to_frame(d)
>>> print(df)
```

	period1	period2	period3
coal	1	5	7
copper	5	7	9
steel	8	4	3

**sasoptpy.exp\_range****exp\_range** (*start*, *stop*, *step=1*)

Creates a set within given range

**Parameters****start** [Expression] First value of the range**stop** [Expression] Last value of the range**step** [Expression, optional] Step size of the range**Returns****exset** [Set] Set that represents the range**Examples**

```
>>> N = so.Parameter(name='N')
>>> p = so.exp_range(1, N)
>>> print(p._defn())
set 1..N;
```

## sasoptpy.flatten\_frame

**flatten\_frame** (*df*, *swap=False*)

Converts a `pandas.DataFrame` object into `pandas.Series`

### Parameters

**df** [`pandas.DataFrame`] DataFrame to be flattened

**swap** [boolean, optional] Option to use columns as first index

### Returns

**new\_frame** [`pandas.DataFrame`] A new DataFrame where indices consist of index and columns names as tuples

## Examples

```
>>> price = pd.DataFrame([
>>>     [1, 5, 7],
>>>     [8, 4, 3],
>>>     [5, 7, 9]], columns=['period1', 'period2', 'period3']).\
>>>     set_index(['coal', 'steel', 'copper'])
>>> print('Price data: \n{}'.format(price))
>>> price_f = so.flatten_frame(price)
>>> print('Price data: \n{}'.format(price_f))
Price data:
      period1  period2  period3
coal         1         5         7
steel        8         4         3
copper        5         7         9
Price data:
(coal, period1)      1
(coal, period2)      5
(coal, period3)      7
(steel, period1)     8
(steel, period2)     4
(steel, period3)     3
(copper, period1)    5
(copper, period2)    7
(copper, period3)    9
dtype: int64
```

## sasoptpy.get\_solution\_table

**get\_solution\_table** (\**argv*, *key=None*, *rhs=False*)

**sasoptpy.quick\_sum****quick\_sum** (*argv*)**sasoptpy.reset****reset** ()

Resets package configs and internal counters

**Abstract Actions**

<code>actions.read_data(table, index, columns)</code>	Reads data tables inside Set and Parameter objects
<code>actions.create_data(table, index, columns)</code>	Creates data tables from variables, parameters and expressions
<code>actions.solve([options, primalin])</code>	Solves the active optimization problem and generates results
<code>actions.for_loop(*args)</code>	Creates a for-loop container that is to be executed on server-side
<code>actions.cofor_loop(*args)</code>	Creates a cofor-loop that is to be executed on server-side concurrently
<code>actions.if_condition(logic_expression, ...)</code>	Creates an if-else block
<code>actions.switch_conditions(*\*args)</code>	Creates several if-else blocks using given arguments
<code>actions.set_value(left, right)</code>	Creates an assignment statement
<code>actions.fix(*args)</code>	Fixes values of variables to given values
<code>actions.unfix(*args)</code>	Unfixes values of variables
<code>actions.set_objective(expression, name, sense)</code>	Sets objective function
<code>actions.print_item(*args)</code>	Prints given argument list on server-side
<code>actions.put_item(*args[, names])</code>	Prints given item values to output log
<code>actions.expand()</code>	Prints expanded problem to output
<code>actions.drop(*args)</code>	Drops given constraints or constraint groups from model
<code>actions.restore(*args)</code>	Restores dropped constraint and constraint groups
<code>actions.union(*args)</code>	Aggregates given sets and set expressions
<code>actions.diff(left, right)</code>	Gets the difference between set and set expressions
<code>actions.substring(main_string, first_pos, ...)</code>	Gets the substring of given positions
<code>actions.use_problem(problem)</code>	Changes the currently active problem

**sasoptpy.actions.read\_data****read\_data** (*table, index, columns*)

Reads data tables inside Set and Parameter objects

**Parameters****table** [string or `swat.cas.table.CASTable`] Table object or name to be read, case insensitive**index** [dict] Index properties of the table

Has two main members:

- **target** [*sasoptpy.abstract.Set*] Target Set object to be read into
- **key** [string, list or None] Column name that will be read from.

For multiple indices it should be a list of string or *sasoptpy.abstract.SetIterator* objects

For a given Set *YEAR* and column name *year\_no*, the index dictionary should be written as:

```
>>> {'target': YEAR, 'key': 'year_no'}
```

If index is simply the row number, use 'key': *so.N* which is equivalent to special *\_N\_* character at SAS language.

**columns** [list] A list of dictionaries, each holding column properties.

Columns are printed in given order. Each column should be represented as a dictionary with following fields:

- **target** [*sasoptpy.abstract.ParameterGroup*] Target parameter object to be read into
- **column** [string] Column name to be read from
- **index** [*sasoptpy.SetIterator*, optional] Sub-index for specific column, needed for complex operations

If the name of the *sasoptpy.abstract.Parameter* object is same as the column name, calling

```
>>> p = so.Parameter(name='price')
>>> read_data(..., columns=[{'target': p}])
```

is enough. For reading a different column name, *column* field should be given:

```
>>> {'target': p, 'column': 'price_usd'}
```

When working with Parameter Group objects, sometimes a secondary loop is needed. This is achieved by using *index* field, along with *sasoptpy.abstract.statement.ReadDataStatement.append()* method.

### Returns

- r** [*sasoptpy.abstract.statement.ReadDataStatement*] Read data statement object, that includes all properties

Additional columns can be added using *sasoptpy.abstract.statement.ReadDataStatement.append()* function.

See also:

*tests.abstract.statement.test\_read\_data.TestReadData*

## Examples

### Reading a regular set

```
>>> with Workspace('test_workspace') as ws:
>>>     ITEMS = Set(name='ITEMS')
>>>     value = ParameterGroup(ITEMS, name='value', init=0)
>>>     get = VariableGroup(ITEMS, name='get', vartype=so.INT, lb=0)
>>>     read_data(
...         table="values",
...         index={'target': ITEMS, 'key': None},
...         columns=[{'target': value}])
>>> print(so.to_optmodel(w))
proc optmodel;
    set ITEMS;
    num value {ITEMS} init 0;
    var get {{ITEMS}} integer >= 0;
    read data values into ITEMS value;
quit;
```

### Reading with row index

```
>>> with so.Workspace('test_read_data_n') as ws:
>>>     ASSETS = so.Set(name='ASSETS')
>>>     ret = so.ParameterGroup(ASSETS, name='return', ptype=so.NUM)
>>>     read_data(
...         table='means',
...         index={'target': ASSETS, 'key': so.N},
...         columns=[{'target': ret}])
...     )
>>> print(so.to_optmodel(w))
proc optmodel;
    set ASSETS;
    num return {ASSETS};
    read data means into ASSETS=[_N_] return;
quit;
```

### Reading with no index set and subindex

```
>>> with so.Workspace('test_read_data_no_index_expression') as ws:
>>>     ASSETS = so.Set(name='ASSETS')
>>>     cov = so.ParameterGroup(ASSETS, ASSETS, name='cov', init=0)
>>>     with iterate(ASSETS, 'asset1') as asset1, iterate(ASSETS, 'asset2') as _
↪ asset2:
>>>         read_data(
...             table='covdata',
...             index={'key': [asset1, asset2]},
...             columns=[
...                 {'target': cov},
...                 {'target': cov[asset2, asset1],
...                  'column': 'cov'}])
>>> print(so.to_optmodel(w))
proc optmodel;
    set ASSETS;
    num cov {ASSETS, ASSETS} init 0;
    read data covdata into [asset1 asset2] cov cov[asset2, asset1]=cov;
quit;
```

### Reading a column with multiple indices

```
>>> with so.Workspace(name='test_read_data_idx_col') as ws:
>>>     dow = so.Set(name='DOW', value=so.exp_range(1, 6))
>>>     locs = so.Set(name='LOCS', settype=so.STR)
>>>     demand = so.ParameterGroup(locs, dow, name='demand')
>>>     with iterate(locs, name='loc') as loc:
>>>         r = read_data(
...             table='dmnd',
...             index={'target': locs, 'key': loc}
...         )
>>>         with iterate(dow, name='d') as d:
>>>             r.append({
...                 'index': d,
...                 'target': demand[loc, d],
...                 'column': concat('day', d)
...             })
>>> optmodel_code = so.to_optmodel(ws)
proc optmodel;
  set DOW = 1..5;
  set <str> LOCS;
  num demand {LOCS, DOW};
  read data dmnd into LOCS=[loc] {d in DOW} < demand[loc, d]=col('day' || d) >;
quit;
```

## sasoptpy.actions.create\_data

### **create\_data** (*table, index, columns*)

Creates data tables from variables, parameters and expressions

#### Parameters

**table** [string] Name of the table to be created

**index** [dict] Table index properties

This dictionary can be empty if no index is needed. It can have following fields:

- **key** [list] List of index keys. Keys can be string or *sasoptpy.abstract.SetIterator* objects
- **set** [list] List of sets, that is being assigned to keys

**columns** [list] List of columns. Columns can be *sasoptpy.abstract.Parameter*, *sasoptpy.abstract.ParameterGroup* objects or dictionaries. If given as a dictionary, each can have following keys:

- **name** [string] Name of the column in output table
- **expression** [*sasoptpy.core.Expression*] Any expression
- **index** [list or *sasoptpy.abstract.SetIterator*] Index for internal loops

The *index* field can be used when a subindex is needed. When given as a list, members should be *sasoptpy.abstract.SetIterator* objects. See examples for more details.

*tests.abstract.statement.test\_create\_data.TestCreateData*

## Examples

### Regular column

```
>>> with so.Workspace('w') as w:
>>>     m = so.Parameter(name='m', value=7)
>>>     n = so.Parameter(name='n', value=5)
>>>     create_data(table='example', index={}, columns=[m, n])
>>> print(so.to_optmodel(w))
proc optmodel;
    num m = 7;
    num n = 5;
    create data example from m n;
quit;
```

### Column with name

```
>>> with so.Workspace('w') as w:
>>>     m = so.Parameter(name='m', value=7)
>>>     n = so.Parameter(name='n', value=5)
>>>     create_data(table='example', index={}, columns=[
...         {'name': 'ratio', 'expression': m/n}
...     ])
>>> print(so.to_optmodel(w))
proc optmodel;
    num m = 7;
    num n = 5;
    create data example from ratio=((m) / (n));
quit;
```

### Column name with concat

```
>>> from sasoptpy.util import concat
>>> with so.Workspace('w') as w:
>>>     m = so.Parameter(name='m', value=7)
>>>     n = so.Parameter(name='n', value=5)
>>>     create_data(table='example', index={}, columns=[
...         {'name': concat('s', n), 'expression': m+n}
...     ])
>>> print(so.to_optmodel(w))
proc optmodel;
    num m = 7;
    num n = 5;
    create data example from col('s' || n)=(m + n);
quit;
```

### Table with index

```
>>> with so.Workspace('w') as w:
>>>     m = so.ParameterGroup(
>>>         so.exp_range(1, 6), so.exp_range(1, 4), name='m', init=0)
>>>     m[1, 1] = 1
>>>     m[4, 1] = 1
>>>     S = so.Set(name='ISET', value=[i**2 for i in range(1, 3)])
>>>     create_data(
...         table='example',
...         index={'key': ['i', 'j'], 'set': [S, [1, 2]]},
...         columns=[m]
```

(continues on next page)

(continued from previous page)

```

...     )
>>> print(so.to_optmodel(w))
proc optmodel;
    num m {1..5, 1..3} init 0;
    m[1, 1] = 1;
    m[4, 1] = 1;
    set ISET = {1,4};
    create data example from [i j] = {{ISET,{1,2}}} m;
quit;

```

### Index over Python range

```

>>> with so.Workspace('w') as w:
>>>     s = so.Set(name='S', value=so.exp_range(1, 6))
>>>     x = so.VariableGroup(s, name='x')
>>>     x[1] = 1
>>>     create_data(table='example',
...                 index={'key': ['i'], 'set': so.exp_range(1, 4)}, columns=[x])
>>> print(so.to_optmodel(w))
proc optmodel;
    set S = 1..5;
    var x {{S}};
    x[1] = 1;
    create data example from [i] = {1..3} x;
quit;

```

### Append column with index

```

>>> from sasoptpy.util import iterate, concat
>>> with so.Workspace('w', session=session) as w:
>>>     alph = so.Set(name='alph', settype=so.string, value=['a', 'b', 'c'])
>>>     x = so.VariableGroup([1, 2, 3], alph, name='x', init=2)
>>>     with iterate(so.exp_range(1, 4), name='i') as i:
>>>         c = create_data(
...             table='example',
...             index={'key': [i], 'set': [i.get_set()]})
>>>         with iterate(alph, name='j') as j:
>>>             c.append(
...                 {'name': concat('x', j),
...                  'expression': x[i, j],
...                  'index': j})
>>> print(so.to_optmodel(w))
proc optmodel;
    set <str> alph = {'a','b','c'};
    var x {{1,2,3}, {alph}} init 2;
    create data example from [i] = {{1..3}} {j in alph} < col('x' || j)=(x[i, j])_
↪>;
quit;

```

### Multiple column indices

```

>>> from sasoptpy.util import concat, iterate
>>> with so.Workspace('w') as w:
>>>     S = so.Set(name='S', value=[1, 2, 3])
>>>     T = so.Set(name='T', value=[1, 3, 5])
>>>     x = so.VariableGroup(S, T, name='x', init=1)
>>>     with iterate(S, name='i') as i, iterate(T, name='j') as j:

```

(continues on next page)

(continued from previous page)

```

>>>         create_data(
...             table='out',
...             index={},
...             columns=[
...                 {'name': concat('x', concat(i, j)), 'expression': x[i, j],
...                  'index': [i, j]})
>>> print(so.to_optmodel(w))
proc optmodel;
    set S = {1,2,3};
    set T = {1,3,5};
    var x {{S},{T}} init 1;
    create data out from {i in S, j in T} < col('x' || i || j)=(x[i, j]) >;
quit;

```

## sasoptpy.actions.solve

**solve** (*options=None, primalin=False*)

Solves the active optimization problem and generates results

### Parameters

**options** [dict, optional] Solver options

This dictionary can have several fields.

- **with** [string] Name of the solver, see possible values under Notes.

See [Solver Options](#) for a list of solver options. All fields in options (except *with*) is passed directly to the solver.

**primalin** [bool, optional] Switch for using existing variable values as an initial point in MILP solver

### Returns

ss [[sasoptpy.abstract.statement.SolveStatement](#)] Solve statement object.

Contents of the response can be grabbed using *get\_response* function.

## Notes

Possible solver names for *with* parameter:

- *lp* : Linear programming
- *milp* : Mixed integer linear programming
- *nlp* : General nonlinear programming
- *qp* : Quadratic programming
- *blackbox* : Black-box optimization

SAS Optimization also has Constraint Programming (clp) and Network Solver (network) but they are not currently supported.

## Examples

### Regular solve

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1, ub=10)
>>>     o = so.Objective(2*x, sense=so.maximize, name='obj')
>>>     s = solve()
>>>     p = print_item(x)
>>> print(so.to_optmodel(w))
proc optmodel;
    var x >= 1 <= 10;
    max obj = 2 * x;
    solve;
    print x;
quit;
```

### Option alternatives

```
>>> with so.Workspace('w') as w:
>>>     # Problem declaration, etc..
>>>     solve()
>>>     solve(options={'with': 'milp'})
>>>     solve(options={'with': 'milp'}, primalin=True)
>>>     solve(options={'with': 'milp', 'presolver': None, 'feastol': 1e-6,
>>>                     'logfreq': 2, 'maxsols': 3, 'scale': 'automatic',
>>>                     'restarts': None, 'cutmir': 'aggressive'})
>>> print(so.to_optmodel(w))
proc optmodel;
    solve;
    solve with milp;
    solve with milp / primalin;
    solve with milp / presolver=None feastol=1e-06 logfreq=2 maxsols=3_
↪ scale=automatic restarts=None cutmir=aggressive;
quit;
```

## sasoptpy.actions.for\_loop

### for\_loop(\*args)

Creates a for-loop container that is to be executed on server-side

#### Parameters

**args** [*sasoptpy.abstract.Set* objects] Any number of Set objects can be given

#### Returns

**set\_iterator** [*sasoptpy.abstract.SetIterator*, *sasoptpy.abstract.SetIteratorGroup*] Set iterators to be used inside for-loop

See also:

*sasoptpy.actions.cofor\_loop()*

## Notes

For tasks that can be run concurrently, consider using `sasoptpy.actions.cofor_loop()`

## Examples

### Regular for loop

```
>>> with so.Workspace('w') as w:
>>>     r = so.exp_range(1, 11)
>>>     x = so.VariableGroup(r, name='x')
>>>     for i in for_loop(r):
>>>         x[i] = 1
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{1,2,3,4,5,6,7,8,9,10}};
  for {o13 in 1..10} do;
    x[o13] = 1;
  end;
quit;
```

### Nested for loops

```
>>> from sasoptpy.actions import put_item
>>> with so.Workspace('w') as w:
>>>     for i in for_loop(range(1, 3)):
>>>         for j in for_loop(['a', 'b']):
>>>             put_item(i, j)
>>> print(so.to_optmodel(w))
proc optmodel;
  for {o2 in 1..2} do;
    for {o5 in {'a','b'}} do;
      put o2 o5;
    end;
  end;
quit;
```

### Multiple set for-loops

```
>>> with so.Workspace('w') as w:
>>>     r = so.Set(name='R', value=range(1, 11))
>>>     c = so.Set(name='C', value=range(1, 6))
>>>     a = so.ParameterGroup(r, c, name='A', ptype=so.number)
>>>     for (i, j) in for_loop(r, c):
>>>         a[i, j] = 1
>>> print(so.to_optmodel(w))
proc optmodel;
  set R = 1..10;
  set C = 1..5;
  num A {R, C};
  for {o5 in R, o7 in C} do;
    A[o5, o7] = 1;
  end;
quit;
```

## sasoptpy.actions.cofor\_loop

**cofor\_loop** (\*args)

Creates a cofor-loop that is to be executed on server-side concurrently

### Parameters

**args** [*sasoptpy.abstract.Set* objects] Any number of Set objects can be given

### Returns

**set\_iterator** [*sasoptpy.abstract.SetIterator*, *sasoptpy.abstract.SetIteratorGroup*] Set iterators to be used inside cofor-loop

See also:

*sasoptpy.actions.for\_loop()*

## Notes

A cofor-loop runs its content concurrently. For tasks that depend on each other, consider using *sasoptpy.actions.for\_loop()*

## Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(6, name='x', lb=0)
>>>     so.Objective(
>>>         so.expr_sum(x[i] for i in range(6)), name='z', sense=so.MIN)
>>>     a1 = so.Constraint(x[1] + x[2] + x[3] <= 4, name='a1')
>>>     for i in cofor_loop(so.exp_range(3, 6)):
>>>         fix(x[1], i)
>>>         solve()
>>>         put_item(i, x[1], so.Symbol('_solution_status_'), names=True)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{0,1,2,3,4,5}} >= 0;
  min z = x[0] + x[1] + x[2] + x[3] + x[4] + x[5];
  con a1 : x[1] + x[2] + x[3] <= 4;
  cofor {o13 in 3..5} do;
    fix x[1]=o13;
    solve;
    put o13= x[1]= _solution_status_;
  end;
quit;
```

## sasoptpy.actions.if\_condition

**if\_condition** (*logic\_expression*, *if\_statement*, *else\_statement=None*)

Creates an if-else block

### Parameters

**logic\_expression** [*sasoptpy.Constraint* or *sasoptpy.abstract.Condition*]

Logical condition for the True case

For the condition, it is possible to combine constraints, such as

```
>>> a = so.Parameter(value=5)
>>> if_condition((a < 3) | (a > 6), func1, func2)
```

Constraints should be combined using bitwise operators (& for *and*, | for *or*).

**if\_statement** [function or *IfElseStatement*] Python function or if-else statement to be called if the condition is True

**else\_statement** [function or *IfElseStatement*, optional] Python function or if-else statement to be called if the condition is False

## Examples

### Regular condition

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     x.set_value(0.5)
>>>     def func1():
>>>         x.set_value(1)
>>>     def func2():
>>>         x.set_value(0)
>>>     if_condition(x > 1e-6, func1, func2)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x;
  x = 0.5;
  if x > 1e-06 then do;
    x = 1;
  end;
  else do;
    x = 0;
  end;
quit;
```

### Combined conditions

```
>>> with so.Workspace('w') as w:
>>>     p = so.Parameter(name='p')
>>>     def case1():
>>>         p.set_value(10)
>>>     def case2():
>>>         p.set_value(20)
>>>     r = so.Parameter(name='r', value=10)
>>>     if_condition((r < 5) | (r > 10), case1, case2)
>>> print(so.to_optmodel(w))
```

(continues on next page)

(continued from previous page)

```

proc optmodel;
  num p;
  num r = 10;
  if (r < 5) or (r > 10) then do;
    p = 10;
  end;
  else do;
    p = 20;
  end;
quit;

```

## sasoptpy.actions.switch\_conditions

**switch\_conditions** (\*\*args)

Creates several if-else blocks using given arguments

### Parameters

**args** : Several arguments can be passed to the function

If an argument is a Constraint or Condition (combined Constraints) the following callable argument is used as a case

### Examples

```

>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     p = so.Parameter(name='p')
>>>     x.set_value(2.5)
>>>     def func1():
>>>         p.set_value(1)
>>>     def func2():
>>>         p.set_value(2)
>>>     def func3():
>>>         p.set_value(3)
>>>     def func4():
>>>         p.set_value(0)
>>>     switch_conditions(x < 1, func1, x < 2, func2, x < 3, func3, func4)
>>> print(to.optmodel(w))
proc optmodel;
  var x;
  num p;
  x = 2.5;
  if x < 1 then do;
    p = 1;
  end;
  else if x < 2 then do;
    p = 2;
  end;
  else if x < 3 then do;
    p = 3;
  end;
  else do;
    p = 0;
  end;
quit;

```

(continues on next page)

(continued from previous page)

```
end;
quit;
```

## sasoptpy.actions.set\_value

**set\_value** (*left*, *right*)

Creates an assignment statement

### Parameters

**left** [*sasoptpy.Expression*] Any expression (variable or parameter)

**right** [*sasoptpy.Expression* or float] Right-hand-side expression

## Examples

```
>>> with so.Workspace('ex_9_1_matirx_sqrt', session=None) as w:
>>>     so.LiteralStatement('call streaminit(1);')
>>>     n = so.Parameter(name='n', value=5)
>>>     rn = so.Set(name='RN', value=so.exp_range(1, n))
>>>     A = so.ParameterGroup(rn, rn, name='A', value="10-20*rand('UNIFORM')")
>>>     P = so.ParameterGroup(rn, rn, name='P')
>>>     for i in for_loop(rn):
>>>         for j in for_loop(so.exp_range(i, n)):
>>>             set_value(P[i, j], so.expr_sum(A[i, k] * A[j, k] for k in rn))
>>> print(so.to_optmodel(w))
proc optmodel;
  call streaminit(1);
  num n = 5;
  set RN = 1..n;
  num A {RN, RN} = 10-20*rand('UNIFORM');
  num P {RN, RN};
  for {o7 in RN} do;
    for {o10 in o7..n} do;
      P[o7, o10] = sum {k in RN} (A[o7, k] * A[o10, k]);
    end;
  end;
quit;
```

## sasoptpy.actions.fix

**fix** (\*args)

Fixes values of variables to given values

### Parameters

**args** [*sasoptpy.Variable*, float, *sasoptpy.Expression*, tuple] Set of arguments to be fixed

Arguments get paired (if not given in tuples) to allow several fix operations

See also:

*sasoptpy.actions.unfix()*

*tests.abstract.statement.test\_fix\_unfix.TestFix*

## Examples

### Regular fix statement

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     fix(x, 1)
>>>     solve()
>>>     unfix(x)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x;
  fix x=1;
  solve;
  unfix x;
quit;
```

### Multiple fix-unfix

```
>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(4, name='x')
>>>     for i in cofor_loop(range(4)):
>>>         fix((x[0], i), (x[1], 1))
>>>         solve()
>>>         unfix(x[0], (x[1], 2))
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{0,1,2,3}};
  cofor {o7 in 0..3} do;
    fix x[0]=o7 x[1]=1;
    solve;
    unfix x[0] x[1]=2;
  end;
quit;
```

## sasoptpy.actions.unfix

### **unfix** (\*args)

Unfixes values of variables

#### **Parameters**

**args** [*sasoptpy.Variable* objects] Set of arguments to be unfixed

See also:

*sasoptpy.actions.fix()*

*tests.abstract.statement.test\_fix\_unfix.TestFix*

## Examples

### Regular unfix statement

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x')
>>>     fix(x, 1)
>>>     solve()
>>>     unfix(x)
>>> print(so.to_optmodel(w))
proc optmodel;
    var x;
    fix x=1;
    solve;
    unfix x;
quit;
```

### Multiple fix-unfix

```
>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(4, name='x')
>>>     for i in cofor_loop(range(4)):
>>>         fix((x[0], i), (x[1], 1))
>>>         solve()
>>>         unfix(x[0], (x[1], 2))
>>> print(so.to_optmodel(w))
proc optmodel;
    var x {{0,1,2,3}};
    cofor {o7 in 0..3} do;
        fix x[0]=o7 x[1]=1;
        solve;
        unfix x[0] x[1]=2;
    end;
quit;
```

## sasoptpy.actions.set\_objective

**set\_objective** (*expression, name, sense*)

Sets objective function

### Parameters

**expression** [*sasoptpy.Expression*] Objective function

**name** [string] Name of the objective function

**sense** [string] Direction of the objective function, *so.MAX* or *so.MIN*

## Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1)
>>>     set_objective(x ** 3, name='xcube', sense=so.minimize)
>>>     solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  var x >= 1;
  MIN xcube = (x) ^ (3);
  solve;
quit;
```

## sasoptpy.actions.print\_item

**print\_item**(\*args)

Prints given argument list on server-side

### Parameters

**args** [*sasoptpy.Variable*, *sasoptpy.Expression*] Arbitrary number of arguments to be printed

These values are printed on server-side, but can be grabbed after execution

### Returns

**ps** [*sasoptpy.abstract.statement.PrintStatement*] Print statement object.

Contents of the response can be grabbed using *get\_response* function.

## Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1, ub=10)
>>>     o = so.Objective(2*x, sense=so.maximize, name='obj')
>>>     s = solve()
>>>     p = print_item(x)
>>> print(so.to_optmodel(w))
proc optmodel;
  var x >= 1 <= 10;
  max obj = 2 * x;
  solve;
  print x;
quit;
>>> print(p.get_response())
      x
0  10.0
```

## sasoptpy.actions.put\_item

**put\_item** (\*args, names=None)

Prints given item values to output log

### Parameters

**args** [*sasoptpy.Expression*, string] Arbitrary elements to be put into log

Variables, variable groups, expressions can be printed to log

**names** [bool, optional] Whether name of the arguments be printed in the log

## Examples

### Regular operation

```
>>> with so.Workspace('w') as w:
>>>     for i in for_loop(range(1, 3)):
>>>         for j in for_loop(['a', 'b']):
>>>             put_item(i, j)
>>> print(so.to_optmodel(w))
proc optmodel;
  for {o2 in 1..2} do;
    for {o5 in {'a', 'b'}} do;
      put o2 o5;
    end;
  end;
quit;
```

### Print with names

```
>>> with so.Workspace('w') as w:
>>>     x = so.VariableGroup(6, name='x', lb=0)
>>>     so.Objective(
>>>         so.expr_sum(x[i] for i in range(6)), name='z', sense=so.MIN)
>>>     a1 = so.Constraint(x[1] + x[2] + x[3] <= 4, name='a1')
>>>     for i in cofor_loop(so.exp_range(3, 6)):
>>>         fix(x[1], i)
>>>         solve()
>>>         put_item(i, x[1], so.Symbol('_solution_status_'), names=True)
proc optmodel;
  var x {{0,1,2,3,4,5}} >= 0;
  min z = x[0] + x[1] + x[2] + x[3] + x[4] + x[5];
  con a1 : x[1] + x[2] + x[3] <= 4;
  cofor {o13 in 3..5} do;
    fix x[1]=o13;
    solve;
    put o13= x[1]= _solution_status_;
  end;
quit;
```

## sasoptpy.actions.expand

### expand()

Prints expanded problem to output

### Examples

```
>>> with so.Workspace(name='w') as w:
>>>     x = so.VariableGroup(3, name='x')
>>>     self.assertEqual(x[0].sym.get_conditions_str(), '')
>>>     # solve
>>>     x[0].set_value(1)
>>>     x[1].set_value(5)
>>>     x[2].set_value(0)
>>>     c = so.ConstraintGroup(None, name='c')
>>>     with iterate([0, 1, 2], 's') as i:
>>>         with condition(x[i].sym > 0):
>>>             c[i] = x[i] >= 1
>>>     set_objective(x[0], name='obj', sense=so.MIN)
>>>     expand()
>>>     solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  var x {{0,1,2}};
  x[0] = 1;
  x[1] = 5;
  x[2] = 0;
  con c {s in {0,1,2}: x[s].sol > 0} : x[s] >= 1;
  MIN obj = x[0];
  expand;
  solve;
quit;
```

## sasoptpy.actions.drop

### drop(\*args)

Drops given constraints or constraint groups from model

#### Parameters

**args** [*sasoptpy.Constraint*, *sasoptpy.ConstraintGroup*] Constraints to be dropped

See also:

*sasoptpy.actions.restore()*

## Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=1)
>>>     y = so.Variable(name='y', lb=0)
>>>     c = so.Constraint(sm.sqrt(x) >= 5, name='c')
>>>     o = so.Objective(x + y, sense=so.MIN, name='obj')
>>>     s = solve()
>>>     drop(c)
>>>     o2 = so.Objective(x, sense=so.MIN, name='obj2')
>>>     s2 = solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  var x >= 1;
  var y >= 0;
  con c : sqrt(x) >= 5;
  min obj = x + y;
  solve;
  drop c;
  min obj2 = x;
  solve;
quit;
```

## sasoptpy.actions.restore

### restore(\*args)

Restores dropped constraint and constraint groups

#### Parameters

**args** [*sasoptpy.Constraint*, *sasoptpy.ConstraintGroup*] Constraints to be restored

See also:

*sasoptpy.actions.drop()*

## Examples

```
>>> with so.Workspace('w') as w:
>>>     x = so.Variable(name='x', lb=-1)
>>>     set_objective(x**3, name='xcube', sense=so.minimize)
>>>     c = so.Constraint(x >= 1, name='xbound')
>>>     solve()
>>>     drop(c)
>>>     solve()
>>>     restore(c)
>>>     solve()
>>> print(so.to_optmodel(w))
proc optmodel;
  var x >= -1;
  MIN xcube = (x) ^ (3);
  con xbound : x >= 1;
  solve;
  drop xbound;
```

(continues on next page)

(continued from previous page)

```
solve;  
restore xbound;  
solve;  
quit;
```

## sasoptpy.actions.union

**union** (\*args)

Aggregates given sets and set expressions

### Parameters

**args** [*sasoptpy.abstract.Set* and *sasoptpy.abstract.InlineSet*] Objects to be aggregated

### Examples

```
>>> from sasoptpy.actions import union, put_item  
>>> with so.Workspace('w') as w:  
>>>     n = so.Parameter(name='n', value=11)  
>>>     S = so.Set(name='S', value=so.exp_range(1, n))  
>>>     T = so.Set(name='T', value=so.exp_range(n+1, 20))  
>>>     U = so.Set(name='U', value=union(S, T))  
>>>     put_item(U, names=True)  
>>> print(so.to_optmodel(w))  
proc optmodel;  
    num n = 11;  
    set S = 1..n;  
    set T = n+1..20;  
    set U = S union T;  
    put U=;  
quit;
```

## sasoptpy.actions.diff

**diff** (left, right)

Gets the difference between set and set expressions

### Parameters

**left** [*sasoptpy.abstract.Set*] Left operand

**right** [*sasoptpy.abstract.Set*] Right operand

## Examples

```
>>> from sasoptpy.actions import diff, put_item
>>> with so.Workspace('w') as w:
>>>     S = so.Set(name='S', value=so.exp_range(1, 20))
>>>     T = so.Set(name='T', value=so.exp_range(1, 15))
>>>     U = so.Set(name='U', value=diff(S, T))
>>>     put_item(U, names=True)
>>> print(so.to_optmodel(w))
proc optmodel;
  set S = 1..19;
  set T = 1..14;
  set U = S diff T;
  put U;
quit;
```

## sasoptpy.actions.substring

**substring** (*main\_string*, *first\_pos*, *last\_pos*)

Gets the substring of given positions

### Parameters

**main\_string** [*sasoptpy.abstract.Parameter* or string] Main string

**first\_pos** [integer] First position of the substring, starting from 1

**last\_pos** [integer] Last position of the substring

## Examples

```
>>> with so.Workspace('w') as w:
>>>     p = so.Parameter(name='p', value='random_string', ptype=so.STR)
>>>     r = so.Parameter(name='r', value=substring(p, 1, 6), ptype=so.STR)
>>>     put_item(r)
>>> print(so.to_optmodel(w))
proc optmodel;
  str p = 'random_string';
  str r = substr(p, 1, 6);
  put r;
quit;
```

## sasoptpy.actions.use\_problem

**use\_problem** (*problem*)

Changes the currently active problem

### Parameters

**problem** [*sasoptpy.Model*] Model to be activated

## Examples

```
>>> from sasoptpy.actions import use_problem
>>> with so.Workspace('w') as w:
>>>     m = so.Model(name='m')
>>>     m2 = so.Model(name='m2')
>>>     use_problem(m)
>>>     x = so.Variable(name='x')
>>>     use_problem(m2)
>>>     m.solve()
>>>     m2.solve()
>>> print(so.to_optmodel(w))
proc optmodel;
    problem m;
    problem m2;
    use problem m;
    var x;
    use problem m2;
    use problem m;
    solve;
    use problem m2;
    solve;
quit;
```

## Math Functions

<i>math.math_func</i> (exp, op, \*args)	Function wrapper for math functions
<i>math.abs</i> (exp)	Absolute value function
<i>math.log</i> (exp)	Natural logarithm function
<i>math.log2</i> (exp)	Logarithm function to the base 2
<i>math.log10</i> (exp)	Logarithm function to the base 10
<i>math.exp</i> (exp)	Exponential function
<i>math.sqrt</i> (exp)	Square root function
<i>math.mod</i> (exp, divisor)	Modulo function
<i>math.int</i> (exp)	Integer value function
<i>math.sign</i> (exp)	Sign value function
<i>math.max</i> (exp, \*args)	Largest value function
<i>math.min</i> (exp, \*args)	Smallest value function
<i>math.sin</i> (exp)	Sine function
<i>math.cos</i> (exp)	Cosine function
<i>math.tan</i> (exp)	Tangent function

### sasoptpy.math.math\_func

**math\_func** (exp, op, \\*args)

Function wrapper for math functions

#### Parameters

**exp** [Expression] Expression where the math func will be applied

**op** [string] String representation of the math function

**args** [float, optional] Additional arguments

### **sasoptpy.math.abs**

**abs** (*exp*)  
Absolute value function

### **sasoptpy.math.log**

**log** (*exp*)  
Natural logarithm function

### **sasoptpy.math.log2**

**log2** (*exp*)  
Logarithm function to the base 2

### **sasoptpy.math.log10**

**log10** (*exp*)  
Logarithm function to the base 10

### **sasoptpy.math.exp**

**exp** (*exp*)  
Exponential function

### **sasoptpy.math.sqrt**

**sqrt** (*exp*)  
Square root function

### **sasoptpy.math.mod**

**mod** (*exp, divisor*)  
Modulo function

#### **Parameters**

**exp** [Expression] Dividend

**divisor** [Expression] Divisor

### **sasoptpy.math.int**

**int** (*exp*)  
Integer value function

### **sasoptpy.math.sign**

**sign** (*exp*)  
Sign value function

### **sasoptpy.math.max**

**max** (*exp*, \**args*)  
Largest value function

### **sasoptpy.math.min**

**min** (*exp*, \**args*)  
Smallest value function

### **sasoptpy.math.sin**

**sin** (*exp*)  
Sine function

### **sasoptpy.math.cos**

**cos** (*exp*)  
Cosine function

### **sasoptpy.math.tan**

**tan** (*exp*)  
Tangent function

## VERSION HISTORY

This page outlines changes from each release.

### 6.1 v0.2.1 (February 26, 2019)

#### 6.1.1 New Features

- Support for evaluating nonlinear expressions is added, see `Expression.get_value()` and `utils._evaluate()`
- Support for multiple objectives is added for LSO solver, see `Model.set_objective()` and *Multiobjective* example
- Support for spaces inside variable indices is added
- Experimental RESTful API is added

#### 6.1.2 Changes

- Dictionaries inside components are replaced with ordered dictionaries to preserve deterministic behavior
- Math operators are added into the keys of linear coefficient dictionaries
- Some iterators are rewritten by using the *yield* keyword for performance
- `key_name` and `col_names` parameters are added into `read_table()`

#### 6.1.3 Bug Fixes

- Fixed: Using a single variable as an objective is producing incorrect input
- Fixed: `Expression.get_value()` fails to evaluate expressions with operators
- Fixed: `Expression.add()` overrides operators in some instances
- Fixed: Expressions with same components but different operators get summed incorrectly
- Fixed: New version of Viya complains about `pandas.DataFrame` column types
- Syntax fixes for **PEP 8** compliance

### 6.1.4 Notes

- A Jupyter notebook example of the Diet Problem is added
- A new example is added to show usage of experiment RESTful API
- Unit tests are added for development repository
- CD/CI integration is added for the development repository on Gitlab
- Generated models can be checked by using the hash values inside tests.responses

## 6.2 v0.2.0 (July 30, 2018)

### 6.2.1 New Features

- Support for the new *runOptmodel* CAS action is added
- Nonlinear optimization model building support is added for both SAS 9.4 and SAS Viya solvers
- Abstract model building support is added when by using SAS Viya solvers
- New object types, `Set`, `SetIterator`, `Parameter`, `ParameterValue`, `ImplicitVar`, `ExpressionDict`, and `Statement` are added for abstract model building
- `Model.to_optmodel()` method is added for exporting model objects into PROC OPTMODEL codes as a string
- Wrapper functions `read_table()` and `read_data()` are added to read CASTable and DataFrame objects into the models
- Math function wrappers are added
- `__expr` and `__defn` methods are added to all object types for producing OPTMODEL expression and definitions
- Multiple solutions are now being returned when by using *solveMilp* action and can be retrieved by using `Model.get_solution()` method
- `Model.get_variable_value()` is added to get solution values of abstract variables

### 6.2.2 Changes

- Variable and constraint naming schemes are replaced with OPTMODEL equivalent versions
- Variables and constraints now preserve the order they are inserted to the problem
- `Model.to_frame()` method is updated to reflect changes to VG and CG orderings
- Two `solve` methods, `Model.solve_on_cas()` and `Model.solve_on_viya()` are merged into `Model.solve()`
- `Model.solve()` method checks the available CAS actions and uses *runOptmodel* whenever possible
- As part of the merging process, `lp` and `milp` arguments are replaced with `options` argument in `Model.solve()` and `Model.to_optmodel()`
- An optional argument `frame` is added to `Model.solve()` for forcing to use MPS mode and *solveLp-solveMilp* actions
- Minor changes are applied to `__str__` and `__repr__` methods
- Creation indices for objects are being kept by using the return of the `register_name()` function

- Objective constant values are now being passed by using new CAS action arguments when possible
- A linearity check is added for models
- Test folder is added to the repository

### 6.2.3 Bug Fixes

- Nondeterministic behavior when generating MPS files is fixed.

### 6.2.4 Notes

- Abstract and nonlinear models can be solved on Viya only if *runOptmodel* action is available on the CAS server.
- Three new examples are added which demonstrate abstract model building.
- Some minor changes are applied to the existing examples.

## 6.3 v0.1.2 (April 24, 2018)

### 6.3.1 New Features

- As an experimental feature, *sasoptpy* supports *saspy* connections now
- `Model.solve_local()` method is added for solving optimization problems by using SAS 9.4 installations
- `Model.drop_variable()`, `Model.drop_variables()`, `Model.drop_constraint()`, `Model.drop_constraints()` methods are added
- `Model.get_constraint()` and `Model.get_constraints()` methods are added to grab *Constraint* objects in a model
- `Model.get_variables()` method is added
- `_dual` attribute is added to the *Expression* objects
- `Variable.get_dual()` and `Constraint.get_dual()` methods are added
- `Expression.set_name()` method is added

### 6.3.2 Changes

- Session argument accepts `saspy.SASsession` objects
- `VariableGroup.mult()` method now supports `pandas.DataFrame`
- Type check for the `Model.set_session()` is removed to support new session types
- Problem and solution summaries are not being printed by default anymore, see `Model.get_problem_summary()` and `Model.get_solution_summary()`
- The default behavior of dropping the table after each solve is changed, but can be controlled with the `drop` argument of the `Model.solve()` method

### 6.3.3 Bug Fixes

- Fixed: Variables do not appear in MPS files if they are not used in the model
- Fixed: `Model.solve()` primalin argument does not pass into options

### 6.3.4 Notes

- A `.gitignore` file is added to the repository.
- A new example is added: Decentralization.
- Both *CAS/Viya* and *SAS* versions of the new example are available.
- There is a known issue with the nondeterministic behavior when creating MPS tables. This will be fixed with a hotfix after the release.
- A new option (no-ex) is added to makedocs script for skipping examples when building docs.

## 6.4 v0.1.1 (February 26, 2018)

### 6.4.1 New Features

- Initial value argument 'init' is added for *Variable* objects
- `Variable.set_init()` method is added for variables
- Initial value option 'primalin' is added to `Model.solve()` method
- Table name argument 'name', table drop option 'drop' and replace option 'replace' are added to `Model.solve()` method
- Decomposition block implementation is rewritten, block numbers does not need to be consecutive and ordered `Model.upload_user_blocks()`
- `VariableGroup.get_name()` and `ConstraintGroup.get_name()` methods are added
- `Model.test_session()` method is added for checking if session is defined for models
- `quick_sum()` function is added for faster summation of *Expression* objects

### 6.4.2 Changes

- `methods.py` is renamed to `utils.py`

### 6.4.3 Bug Fixes

- Fixed: Crash in VG and CG when a key not in the list is called
- Fixed: `get_value` of pandas is depreceated
- Fixed: Variables can be set as temporary expressions
- Fixed: Ordering in `get_solution_table()` is incorrect for multiple entries

## 6.5 v0.1.0 (December 22, 2017)

- Initial release
